## An inductive approach to Cauchy's Theorem

### CT for a finite abelian group $A$

**Theorem** Let  $A$  be a finite abelian group and suppose that  $p$  is a prime number which divides  $|A|$ . It follows that there is an element  $g \in A$  with  $o(g) = p$ .

**Proof** If any proper subgroup has order divisible by  $p$ , then we can use an induction on  $|A|$  to finish. Thus we may assume that every proper subgroup of  $A$  has order coprime to  $p$ . Let  $M$  be a proper subgroup of  $A$  of maximal size. Choose  $x \in A$  with  $x \notin M$ . Let  $X = \langle x \rangle$ . Now  $G = MX$  by maximality of  $M$ , so  $p$  divides

$$|G| = |M| \cdot |X| / |M \cap X| = |X| \cdot |M : M \cap X|.$$

Now  $|M|$  and hence  $|M : M \cap X|$  is coprime to  $p$ . Thus  $p$  divides  $|X| = o(x) = ps$ . Now  $y = x^s \neq 1$  but  $y^p = x^{o(x)} = 1$  and therefore  $y$  has order  $p$ .

### CT for a finite group $G$

**Theorem** Let  $G$  be a finite group and suppose that  $p$  is a prime number which divides  $|G|$ . It follows that there is an element  $g \in G$  with  $o(g) = p$ .

**Proof** We induct on  $|G|$ , the result being vacuously true for the trivial group. If any proper subgroup  $H$  of  $G$  has index  $|G : H|$  coprime to  $p$ , then  $p$  divides  $|H|$  and induction applies, so  $H$  contains an element of order  $p$ .

Thus we are done unless every proper subgroup of  $G$  has index divisible by  $p$ . In this case, if  $\mathbf{C}$  is any conjugacy class of  $G$  which is not a singleton set, then choosing  $y \in \mathbf{C}$ , we find that

$$|\mathbf{C}| = |G : C_G(y)| \equiv 0 \pmod{p}.$$

Now  $|G| \equiv 0 \pmod{p}$  and  $|G|$  is the sum of the sizes of its conjugacy classes. Working modulo  $p$  we discover that the number of conjugacy classes of  $G$  which are singleton sets is a multiple of  $p$ . However, the set  $\{t\}$  is a conjugacy class of  $G$  if and only if

$$t \in Z(G) = \{z \in G \mid zg = gz \forall g \in G\}.$$

Thus  $p$  divides  $|Z(G)|$ . Now apply Cauchy's theorem to the abelian group  $Z(G)$  to produce an element of  $G$  of order  $p$ .
