Creating Value from a Circular Economy

Professor Fiona Charnley

Director of the Exeter Centre for the Circular Economy

Director of the UKRI Circular Economy Hub

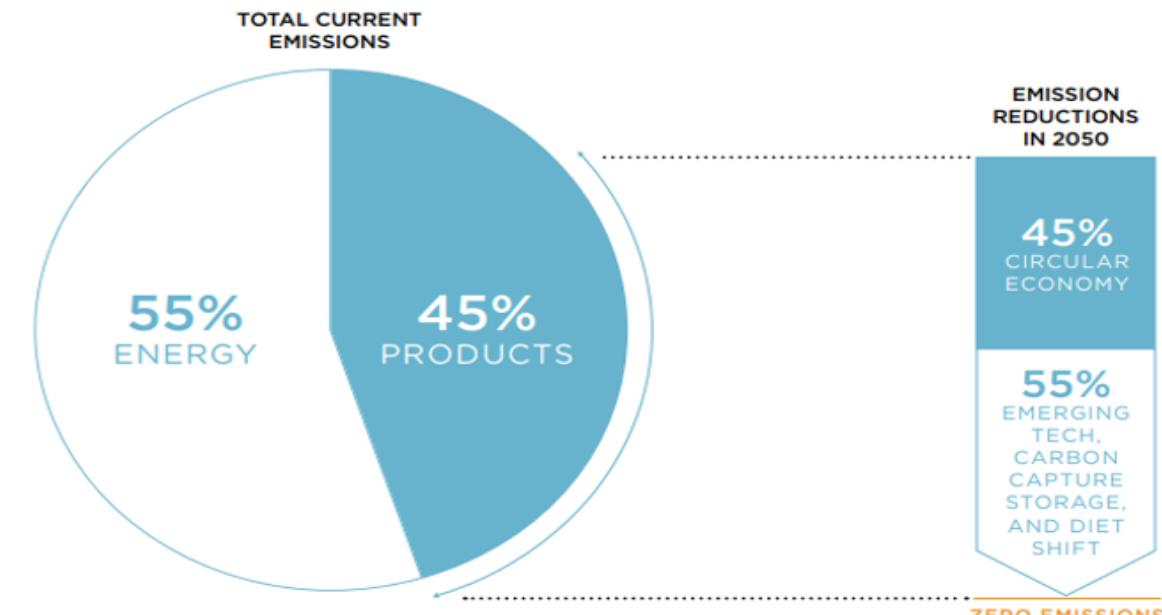

Setting the Scene

University
of Exeter

Each year, the UK requires 1.2Bn tonnes of materials to sustain the current economy

- 92M Tons of textile waste produced globally each year, 87% end up in landfill or incineration, <1% are recycled, the average garment is worn 7-10 times
- Global use of construction minerals ~ 55 Gt in 2020
- The Chemical sector is the UK's second highest industrial emitter with 18.4 million tonnes of CO2 emissions
- The extraction of seven major metals (Fe, Al, Cu, Pb, Mn, Ni and Zn) accounts for 15% of the global primary energy demand and 12% of the global GHG emission

Climate change is as much an economic and social crisis as it is an environmental crisis: the costs of climate change to the global economy are projected to amount to **\$54 trillion** by the end of the century

[Completing the picture: How the circular economy tackles climate change \(ellenmacarthurfoundation.org\)](http://ellenmacarthurfoundation.org)

The Materials Challenge

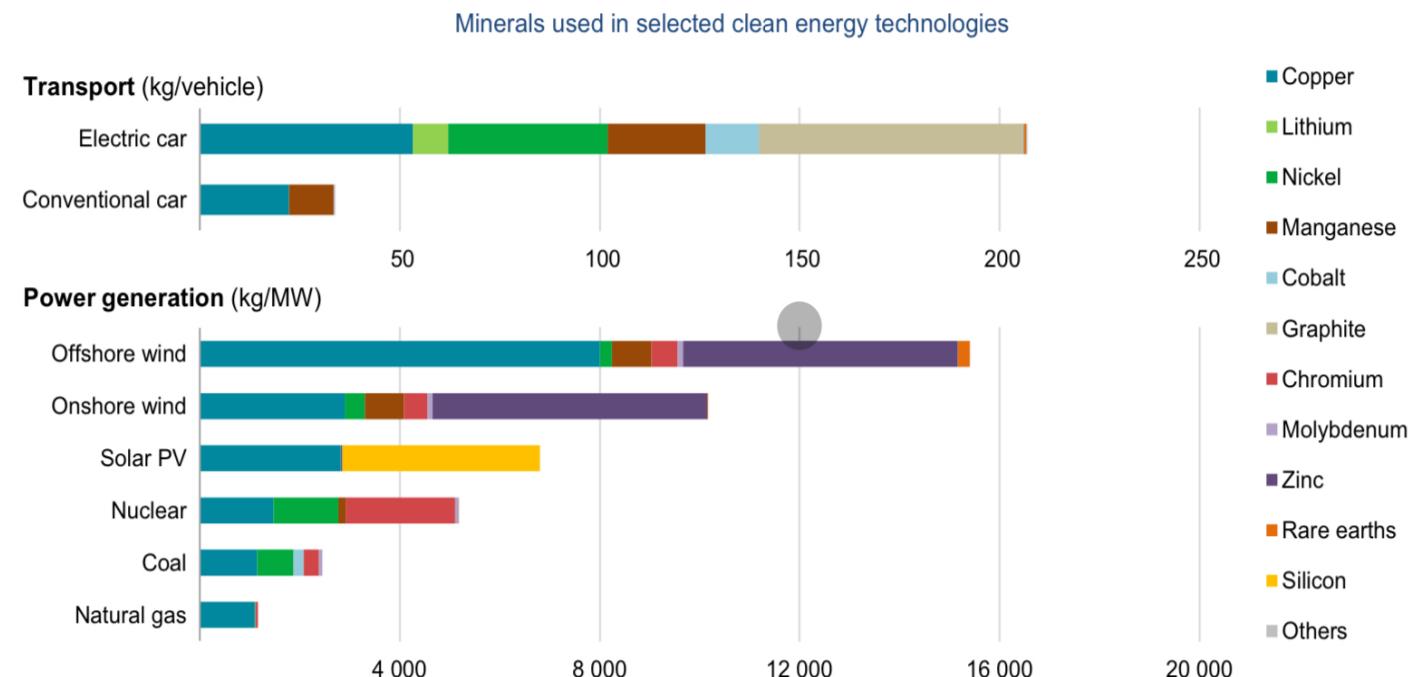

To replace all UK ICE vehicles with electric would require:

- 2x total annual world Co production
- World production of Nd
- 75% of the world's Li production

Only 4 of the 27 raw materials considered critical by the EU in 2017 have an end-of-life recycling input rate (EU EOL-RIR) of 10% or higher

Currently, the UK remains close to 100% import reliance for these metals, most of which arrive already in components or products

The rapid deployment of clean energy technologies as part of energy transitions implies a significant increase in demand for minerals

(2024) Product life extension behaviours for electrical appliances in UK households: Can consumer education help extend product life amid the cost-of-living crisis? *Resources, Conservation and Recycling*, 205, 107527, <https://doi.org/10.1016/j.resconrec.2024.107527>

A Value Led Approach to Design

University
of Exeter

Taxonomy of Value

The Taxonomy of Value framework, developed by Haines-Gadd and Charnley (2019), helps to identify and understand the different types of value available within the circular economy system. Through literature review and case study analysis they propose there is **Tangible/Explicit** and **Intangible/implicit** value within the Circular Economy.

Tangible/explicit value is value that can be capitalized upon:

- *Resource value, Customer Value, Relationship Value, Data/knowledge Value*

Intangible/implicit value is value that is generated as a result of circular systems:

- *Stability and control, Symbiosis, Positive Social Impact, Altruism, Behaviour Change*

University
of Exeter

Types of Tangible / Explicit Value

Resource Value

Product, materials, energy, people, space, processes, waste streams

Consumer Value

Benefits provided to the customer through the product or service

Data/Knowledge Value

Data collected from your product or service, patents, innovations

Relationship Value

Value of networks & partnerships, consumer loyalty, consumer lifetime value

Types of Intangible / Implicit Value

Circular Business Models

University
of Exeter

Circular Supplies

Optimising the design of materials or products using of renewable energy, bio-based or fully recyclable input material to replace single-lifecycle inputs

Resource recovery

Recover useful resources and energy out of disposed products or by-products

Product Life Extension

Extend working lifecycle of products and components by repairing, upgrading and reselling

Product as a service

Offer product access and retain ownership to internalise benefits of circular resource productivity.

Enabling Solutions

Enabling resource productivity, including extending asset life, enhancing multiple use cycles and reducing waste.

TRANSFORM

DONATE

Solar PV

£3.5Bn turnover & 11,500 jobs in 2022 in the UK
CAGR approx. 30% between 2011-2021 in the UK & worldwide
UK govt. has strong ambitions to grow solar capacity 5 times by 2035, equal to 70GW

University
of Exeter

Extended lifespan and high value recycling of solar panels

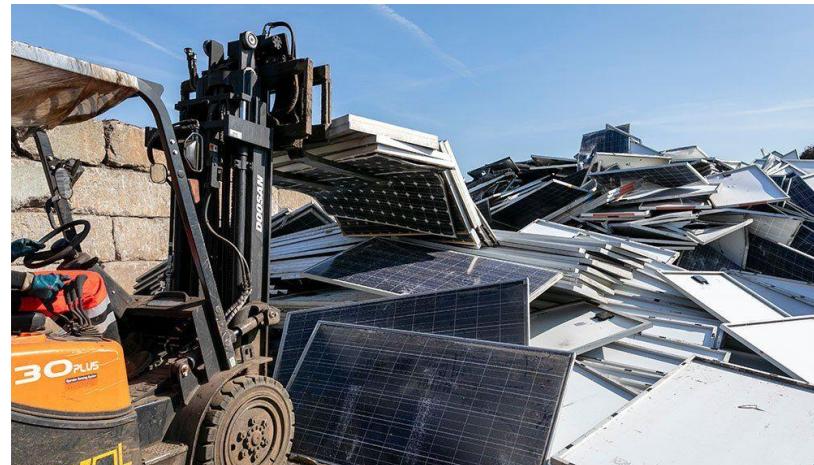

UK currently has 830KT of combined Al, Cu, Ag & glass embedded in solar PV - projected to grow to 6.6mnT by 2050.

Current:

Panels retired at less than 15 years with low recycling rates/ recovery of metals

Opportunity:

Increase recovery rate of metals and feed back into domestic supply chain through high value recycling
Reduced import needs for solar panels

Enabling Solutions

Enabling resource productivity, including extending asset life, enhancing multiple use cycles and reducing waste.

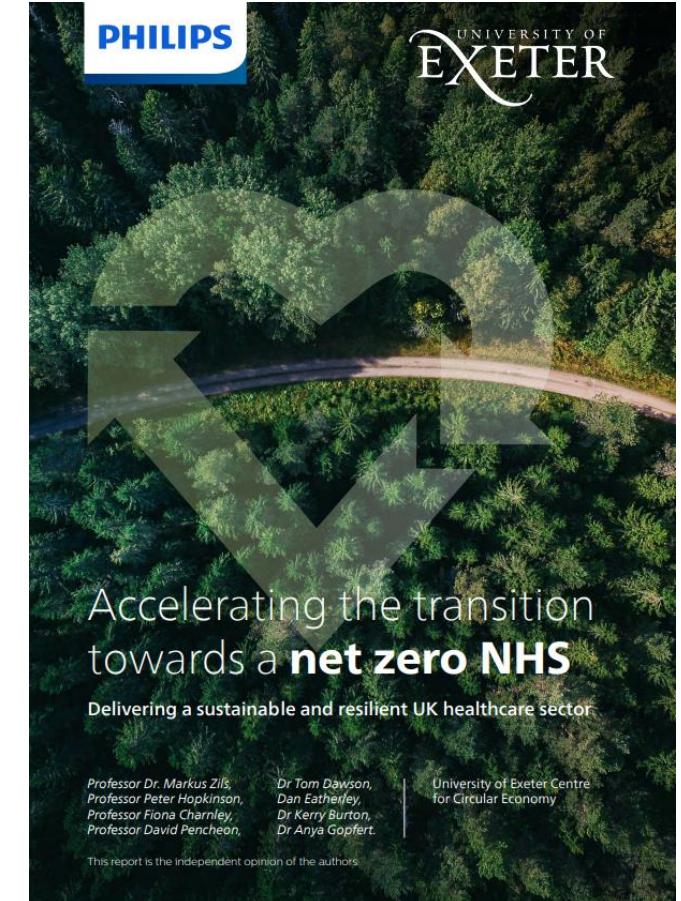

Charnley, F.; Tiwari, D.; Hutabarat, W.; Moreno, M.; Okorie, O.; Tiwari, A. Simulation to Enable a Data-Driven Circular Economy. *Sustainability* 2019, 11(12), 3379; <https://doi.org/10.3390/su11123379>

Adoption and Implementation: Having a good idea is only the start!

- Acceleration and scale up of CE solutions
- Integration of multiple business models – one size does not fit all
- Metrics and KPIs
- Road maps, pilots and experimentation
- Buy-in and education – across all functions
- Technology enabled
- Policy & Legislation
- User Behaviour

University
of Exeter

[Accelerating the Transition Towards a Net Zero NHS](#)

Circular Economy in Business: What have we learned?

University
of Exeter

WANTS

- Detailed case studies and examples of adoption (inc. failure)
- Tools and methods to support collaboration (int. functions and ext. S'holders e.g. suppliers)
- Blueprints, toolkits, guides to support adoption
- Shared learning between functions and sectors

NEEDS

- Evidence to make the business case (int. & ext)
- Specific KPIs to set targets and measure progress
- A common language
- Use of digital tools to accelerate adoption
- Regulatory frameworks & policy
- Persuasion & articulation

CHALLENGES

- Organisational culture, skills, capabilities, mindset & governance
- Behaviour change, influencing consumer participation in CE models
- Whole system approach inc. trade-offs
- Data, analytics, measurement
- Enabling a 'Just Transition'
- Translation of academic theory to practice

Developed in collaboration with:

CIRCULAR BUSINESS MODEL DESIGN GUIDE

A practical guide to help business leaders identify circular opportunities and design business models that create, deliver and capture value

Metrics and KPIs!

Why measure?

- Combatting greenwashing
- In response to external pressures
- To gain further buy-in / make the business case
- To comply with legislation
- To empower others – integrated KPIs throughout the organisation

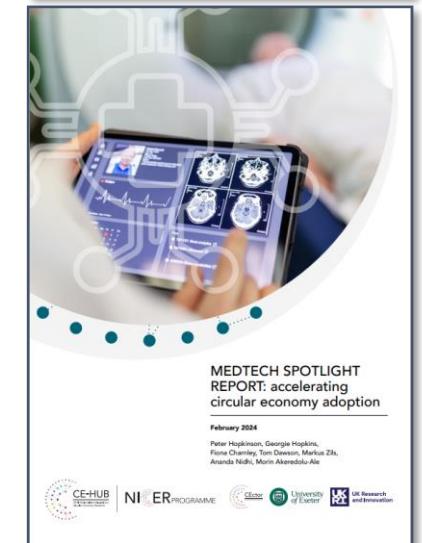

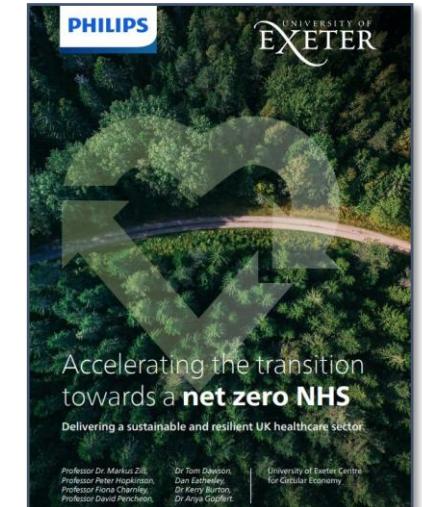

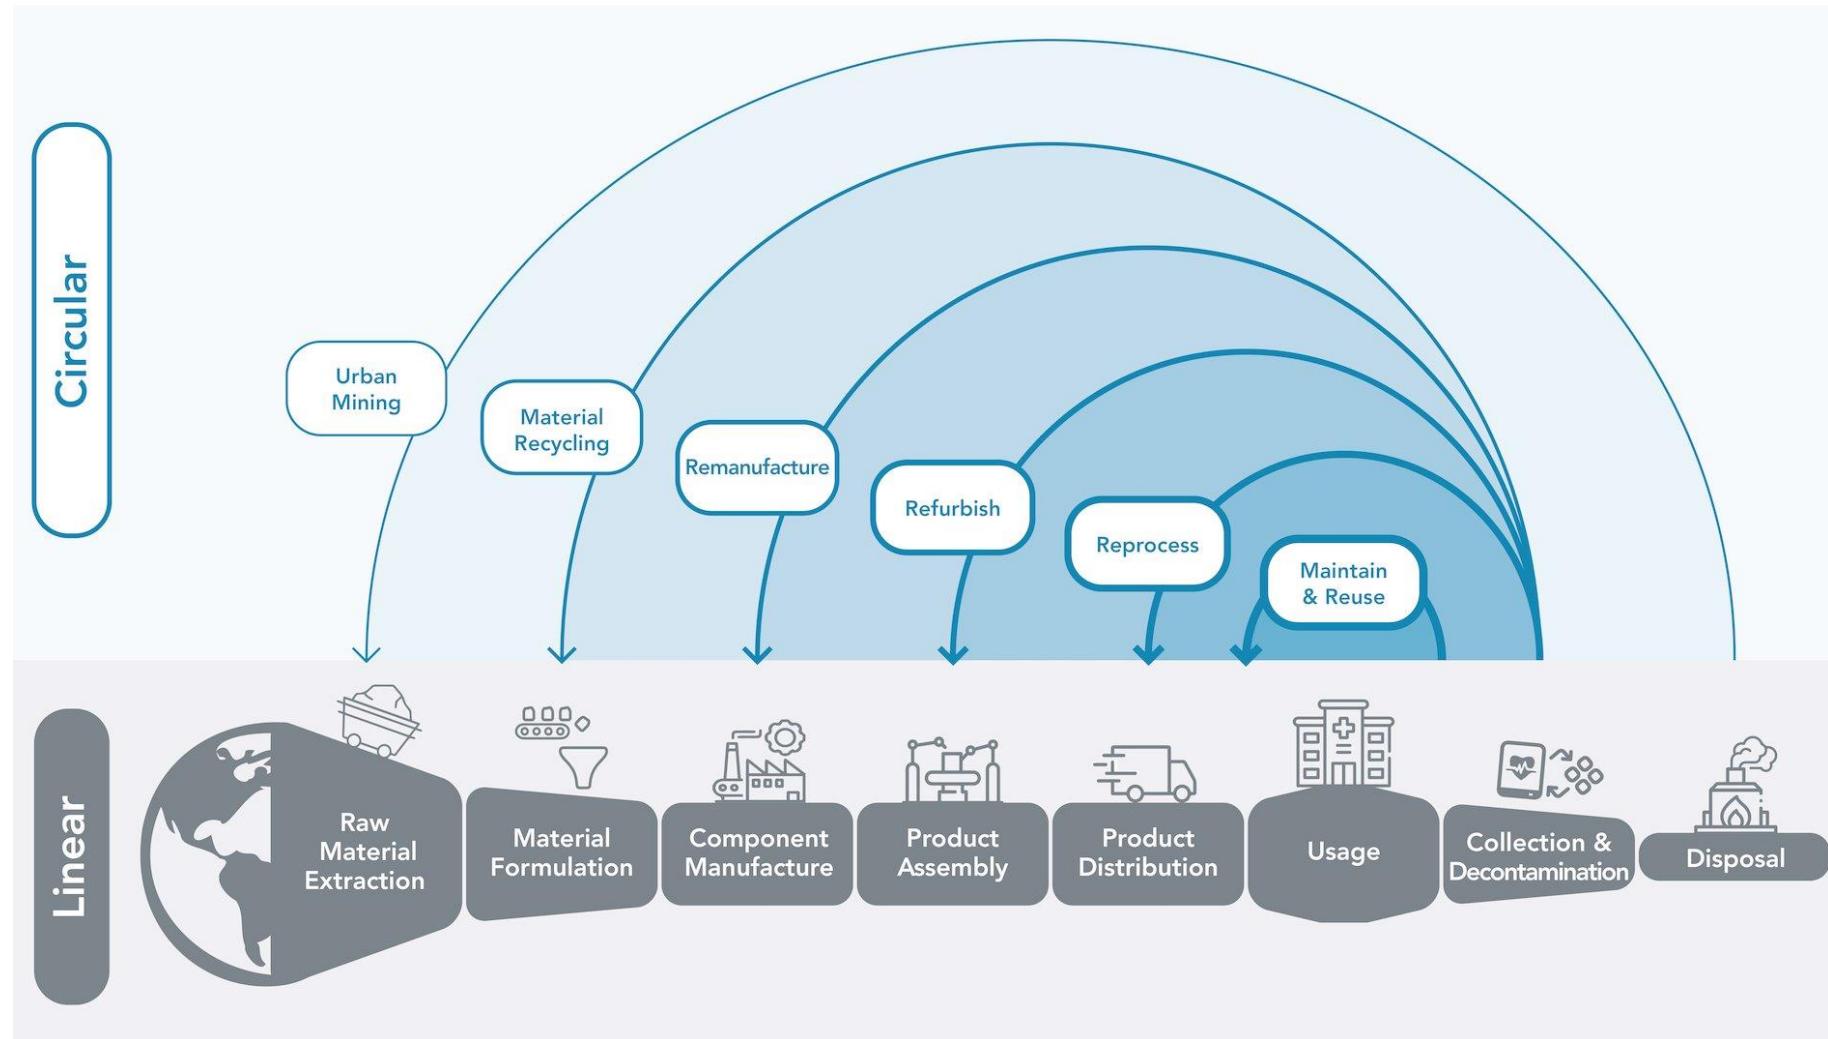

What to measure?

- Percentage (by mass) of physical products designed to be circular
- Employment: jobs generated
- Education: percentage of employees completing CE training

Abstract: Experimentation with, and the implementation of, circular business models (CBMs) has gained rapid traction within the textiles and fashion industry over the last five years. Substitution of virgin materials with biodegradable alternatives, extending the lifecycle of garments through resale, and rental services and the recycling or upcycling of garments are some of the strategies being used to reduce the 1.2 billion tonnes of greenhouse gas emissions and 92 million tonnes of waste associated with the sector in 2017. However, whilst CBMs demonstrate environmental and economic benefits, low consumer acceptance is considered by business professionals and policymakers to be one of the main barriers to the transition towards a circular economy. Digitisation is widely acknowledged as a catalyst for innovation in many sectors and digital technologies are driving new ways to exchange and share goods and services, enabling companies to match the supply and demand for otherwise underused assets and products. Online platforms, in particular, have played a crucial role in driving the growth of used goods and resale in other consumer goods markets, such as consumer technology. A mixed methods approach, including a review of 40 organisations operating second hand fashion models, a consumer survey of over 1200 respondents and in-depth interviews with 10 organisations operating second hand fashion models, is adopted to reveal (a) the barriers to consumer acceptance of reuse models in the fashion industry, and (b) how digital technologies can overcome these barriers. Findings highlight the significant progress that organisations have made in using digitalisation, including data analytics, algorithms, digital platforms, advanced product imagery and data informed customer communications, to address barriers associated with convenience, hygiene, trust and security. Furthermore, the study identifies opportunities for the development of more sophisticated digital technologies to support increased transparency and address concerns associated with the quality, authenticity and sourcing of materials. Positioned at the interface of digitisation and consumer acceptance of circular business models, this study makes an important contribution to understanding consumer barriers and how to address them and concludes with a set of recommendations for practitioners.
