

# Observing the ocean under the melting sea ice.

Hanne Sagen & Stein Sandven

# Key questions about the Arctic Ocean

Fresh water – high stratification

- **How much heat is stored in the Arctic Basin?**
- **How will the freshwater content / upper ocean stratification evolve in the coming years?**
- **What are / will be the implications of upper ocean changes?**
- **What is the feedback of all these changes with the changing sea ice cover?**
- **What is the time and space variability of the warm Atlantic Water circulation?**
- **What are the implications of changes in the intermediate and deep circulation of water masses in the Arctic?**

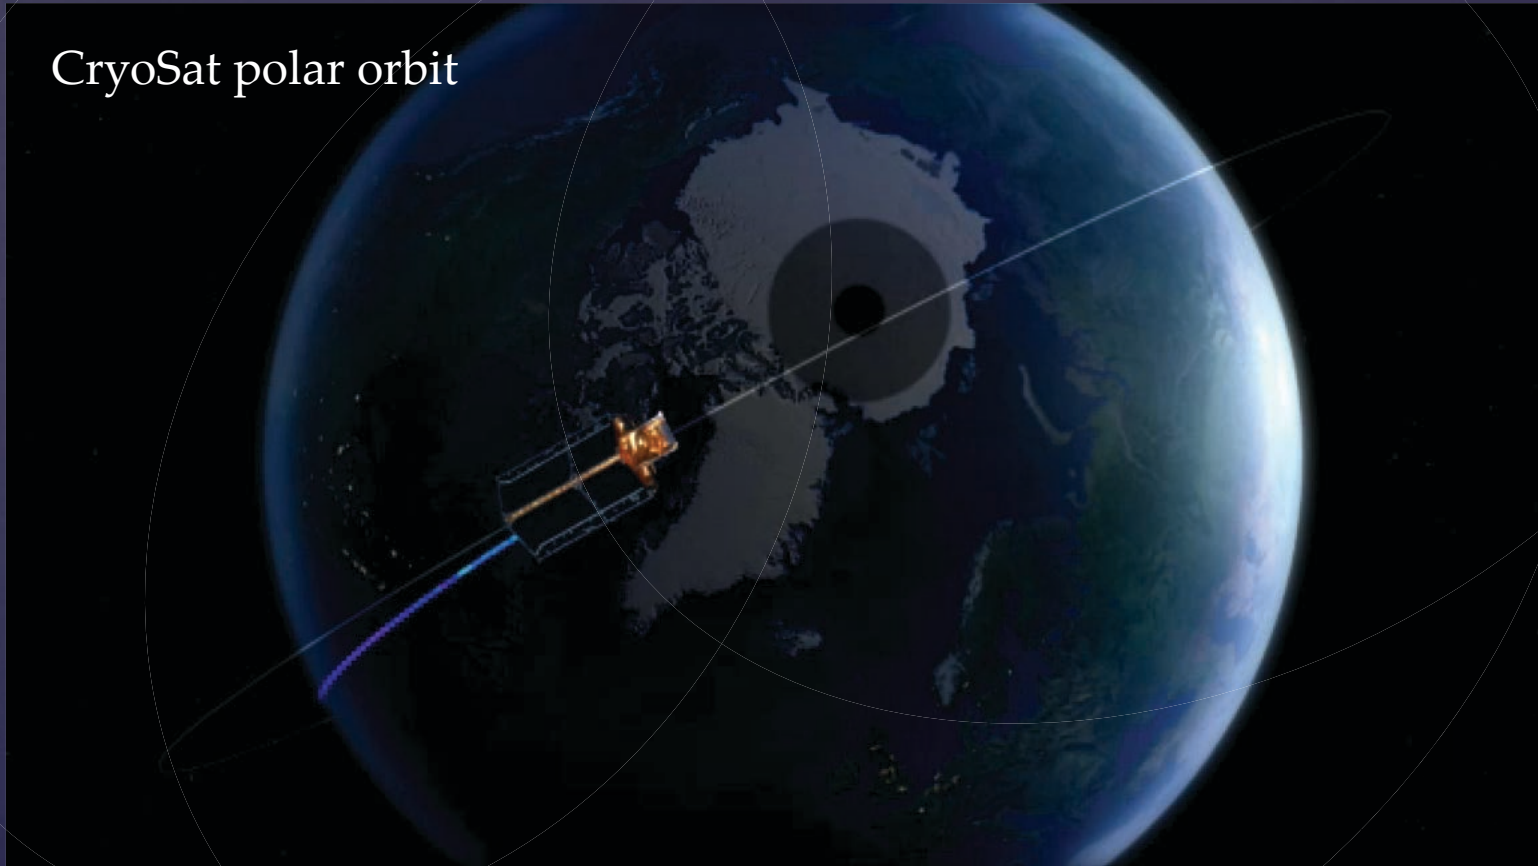

# How can we observe the Arctic Basin to help to answer these questions?

## Outline

- **Challenges in observing the Arctic**
- **The ARGO program**
- **The International Arctic Buoy Program**
- **Multidisciplinary Moorings**
- **Acoustics in an Arctic Ocean Observing system**
- **The Fram Strait observatory (Film)**

# Sea ice observations from satellite remote sensing

CryoSat polar orbit

ARGO is the largest ocean observing system. It is a trans-national system. See Riser et al. 2016 “Fifteen years of ocean observations with the global Argo array”, Nature – Climate Change.

ARGO floats can not yet be used in the Arctic because the ice cover hampers satellite communication.

NANSEN AND AMUNDSEN BASINS  
OBSERVATIONAL SYSTEM

Regional and Basin wide  
multipurpose acoustic networks  
for tomography, underwater  
GPS and passive acoustics.

With funding from  
The Research Council of Norway

GDF SUEZ

# Principle of acoustic measurements

$$V=S/T$$

## Acoustic thermometry

Travel time between source receiver – gives sound speed  
→ temperature

## Acoustic positioning/ localization

Measure travel time –  
known sound speed → gives  
Distance

## Passive listening

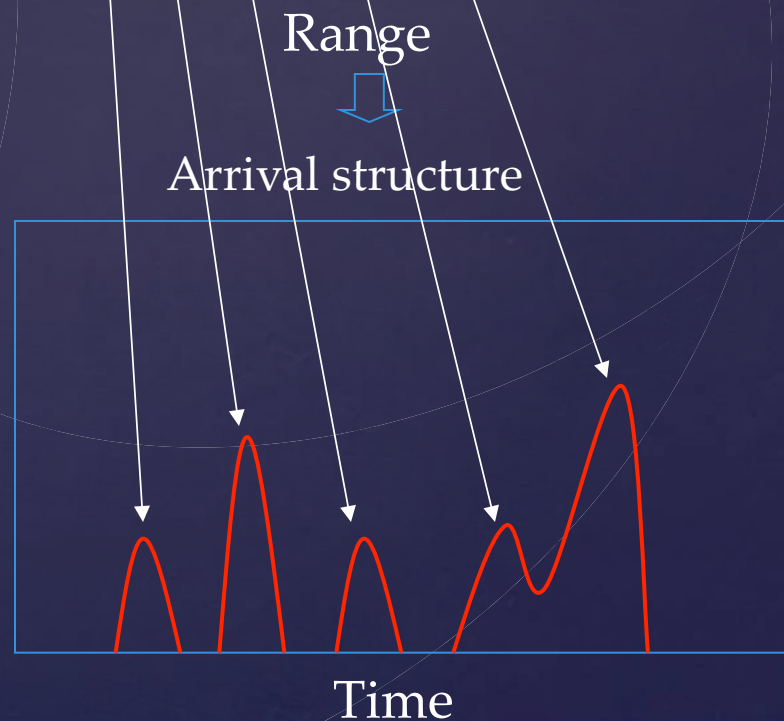

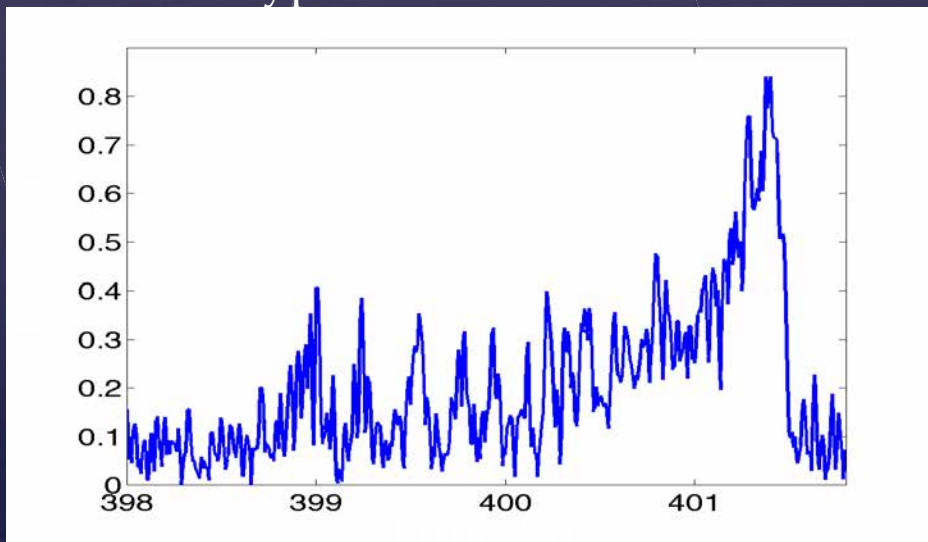

Detect, localize, track sounds  
from different human and  
natural sources.

- ⌘ 1826, Colladon and Sturm
- ⌘ Lake Geneva
- ⌘ Measure distance (navigation) and time

# Concept of acoustic thermometer for the ocean

Typical measurement

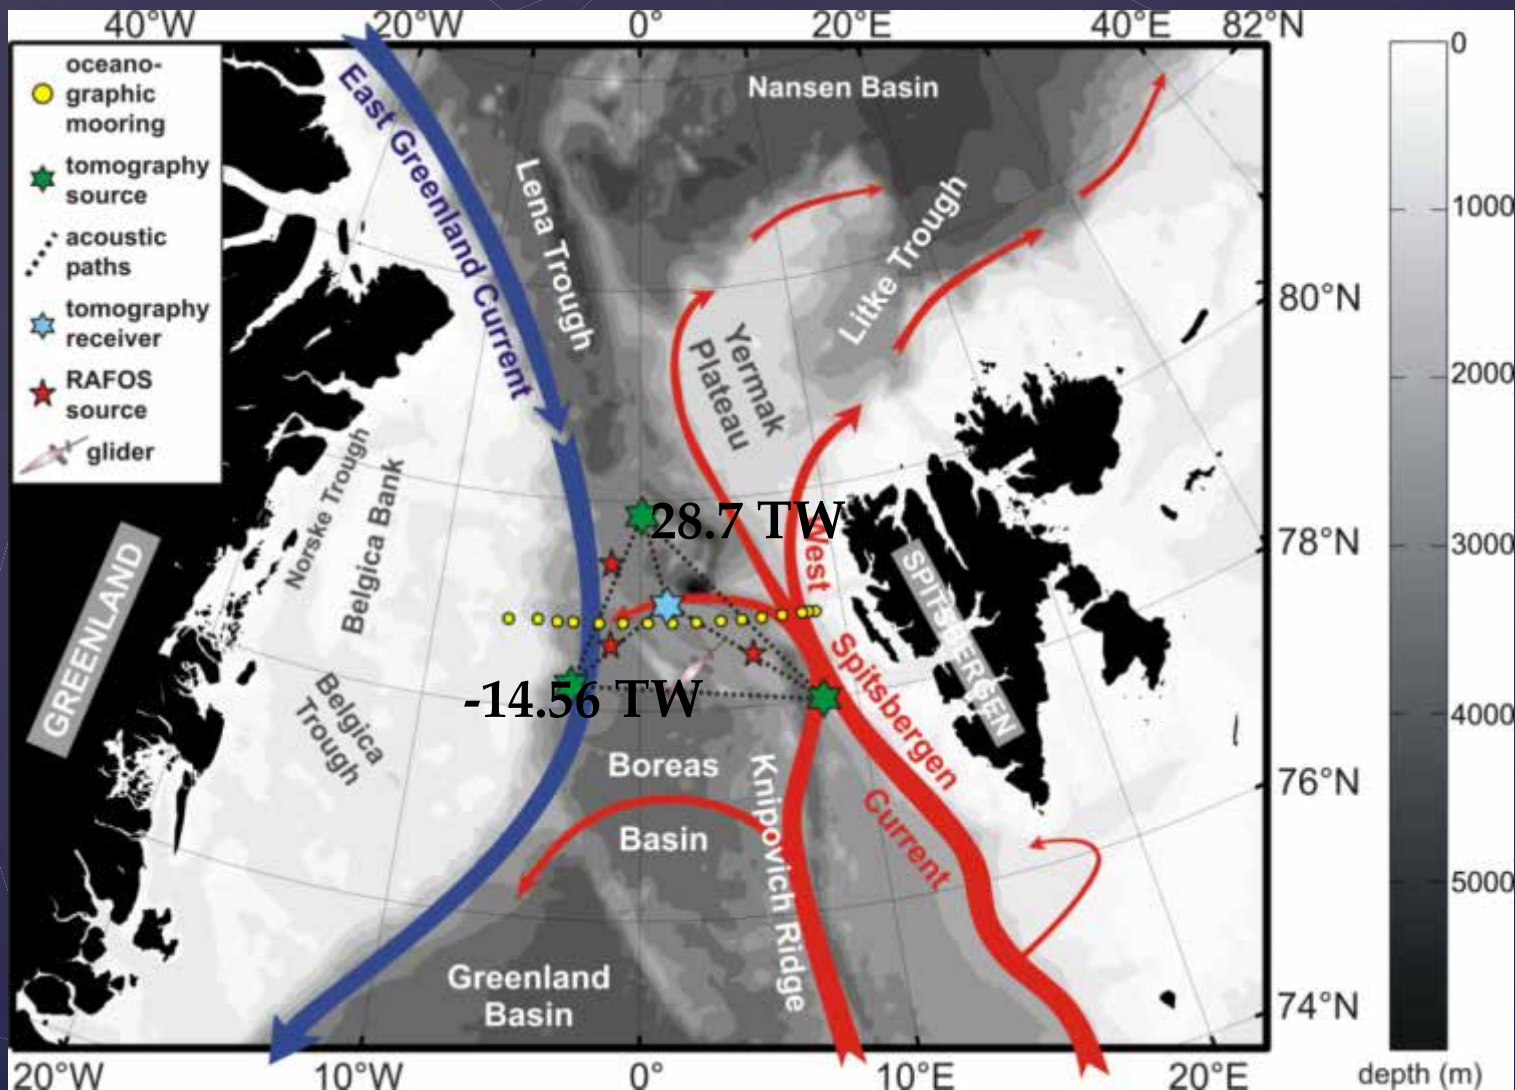

# Fram Strait Ocean Observatory moored array and gliders

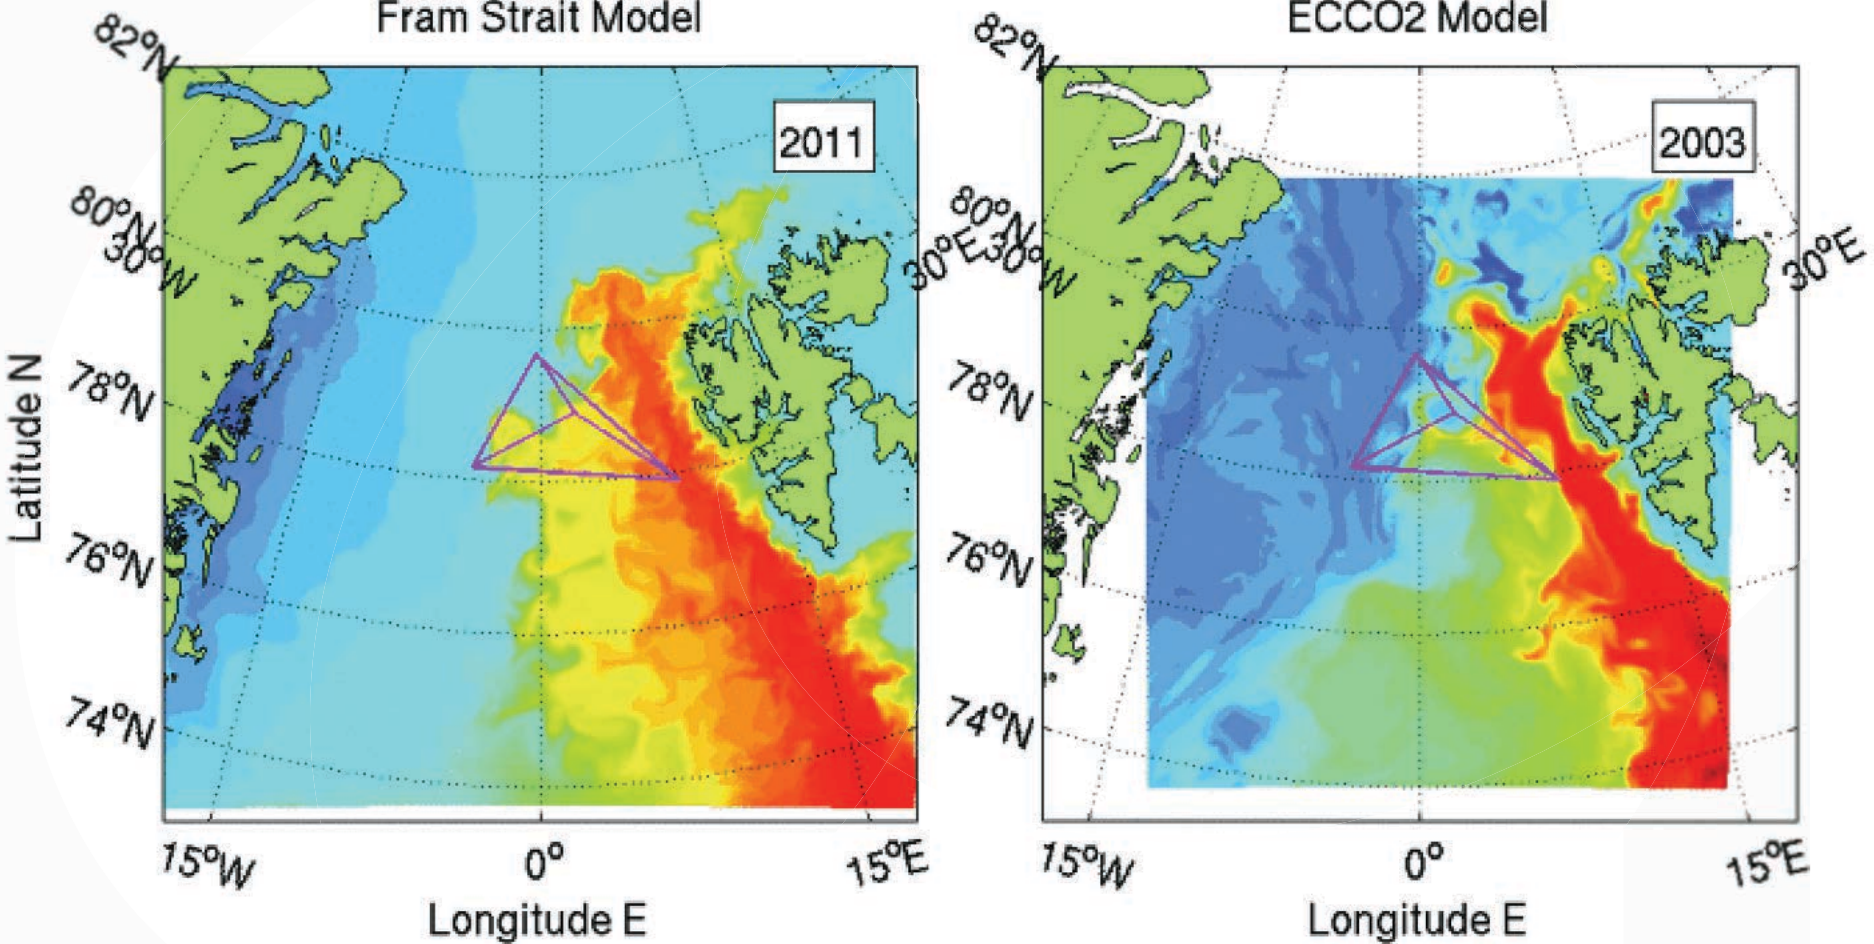

Monitoring volume, heat and salt (freshwater) exchanges between the North Atlantic and the Arctic Ocean

# Sound Speed - 10-m Depth: Yearday 0

## Fram Strait Model

## ECCO2 Model

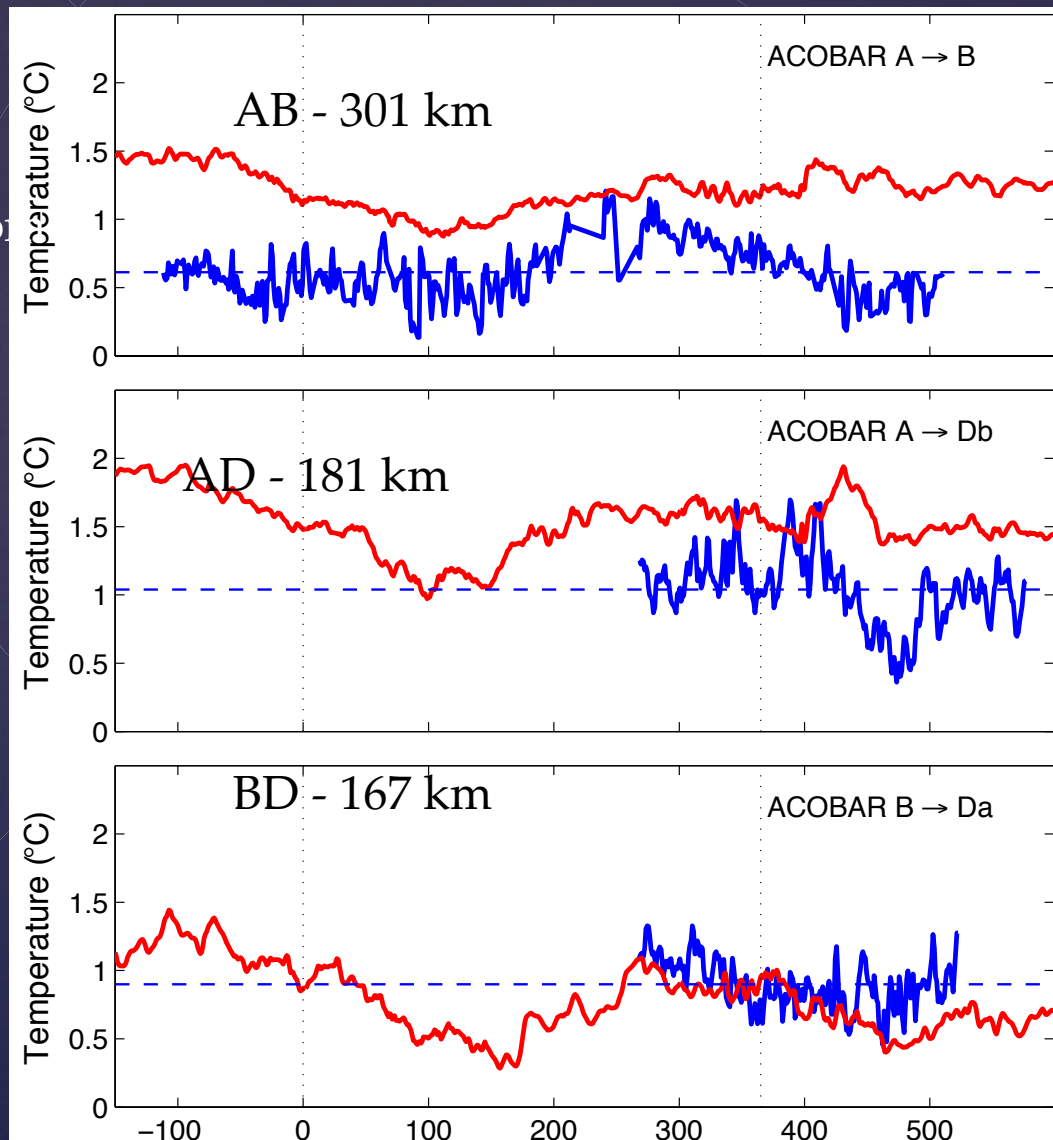

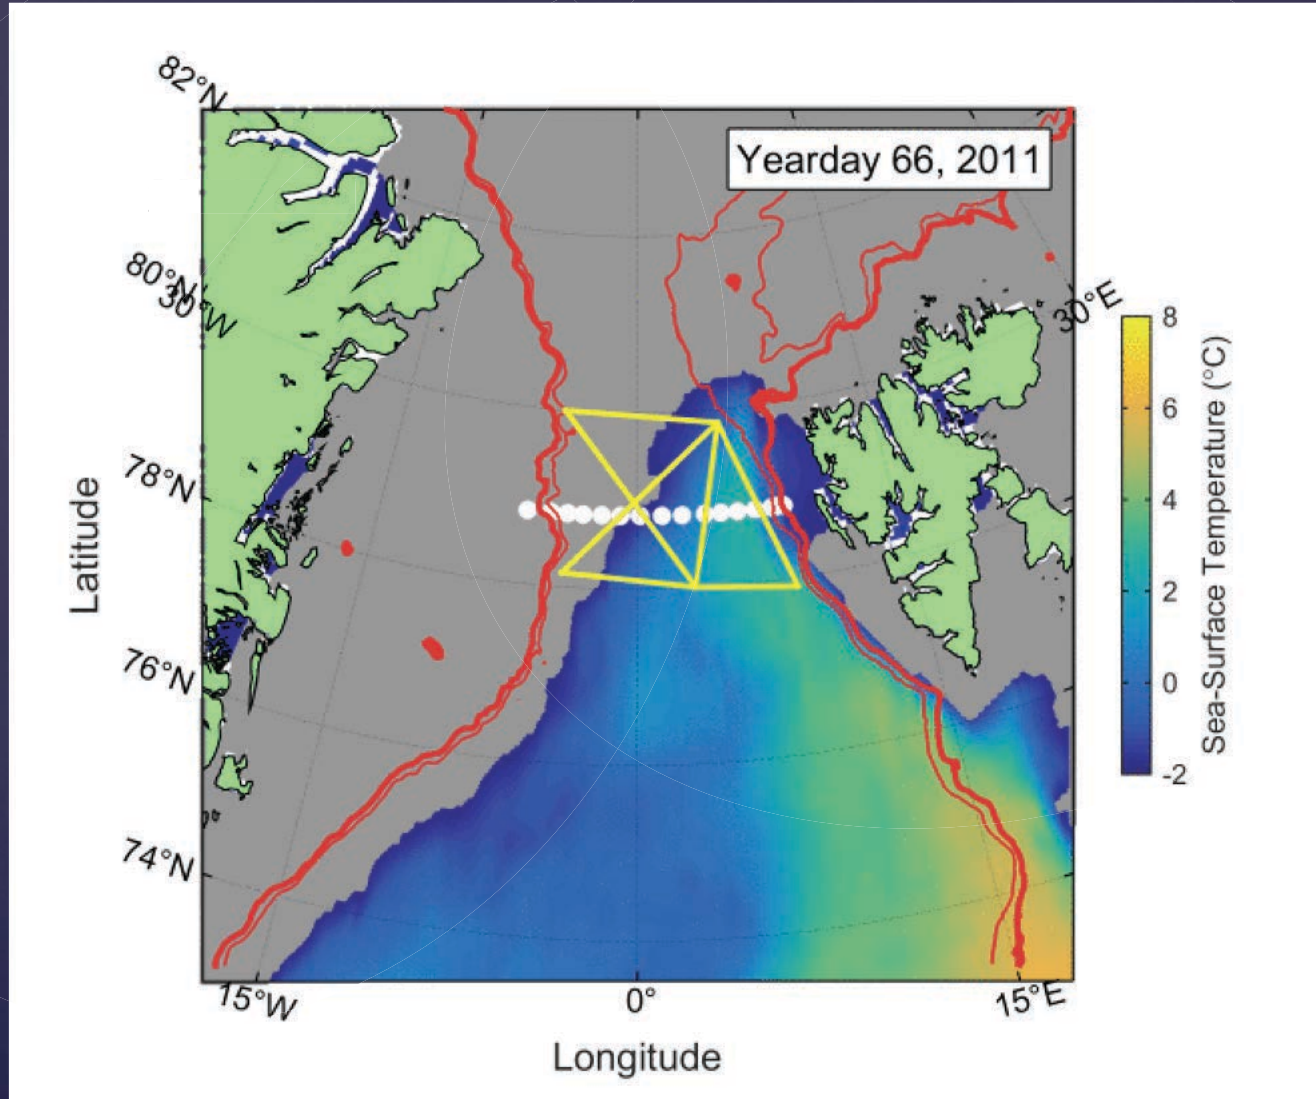

# Model validation results with depth averaged ocean temperatures from acoustic thermometry

Blue line is the acoustically observed Depth-range averaged temperature  
Red line modelled measurements from High resolution ice-ocean model (Hycom, 3 km, 28 layers)

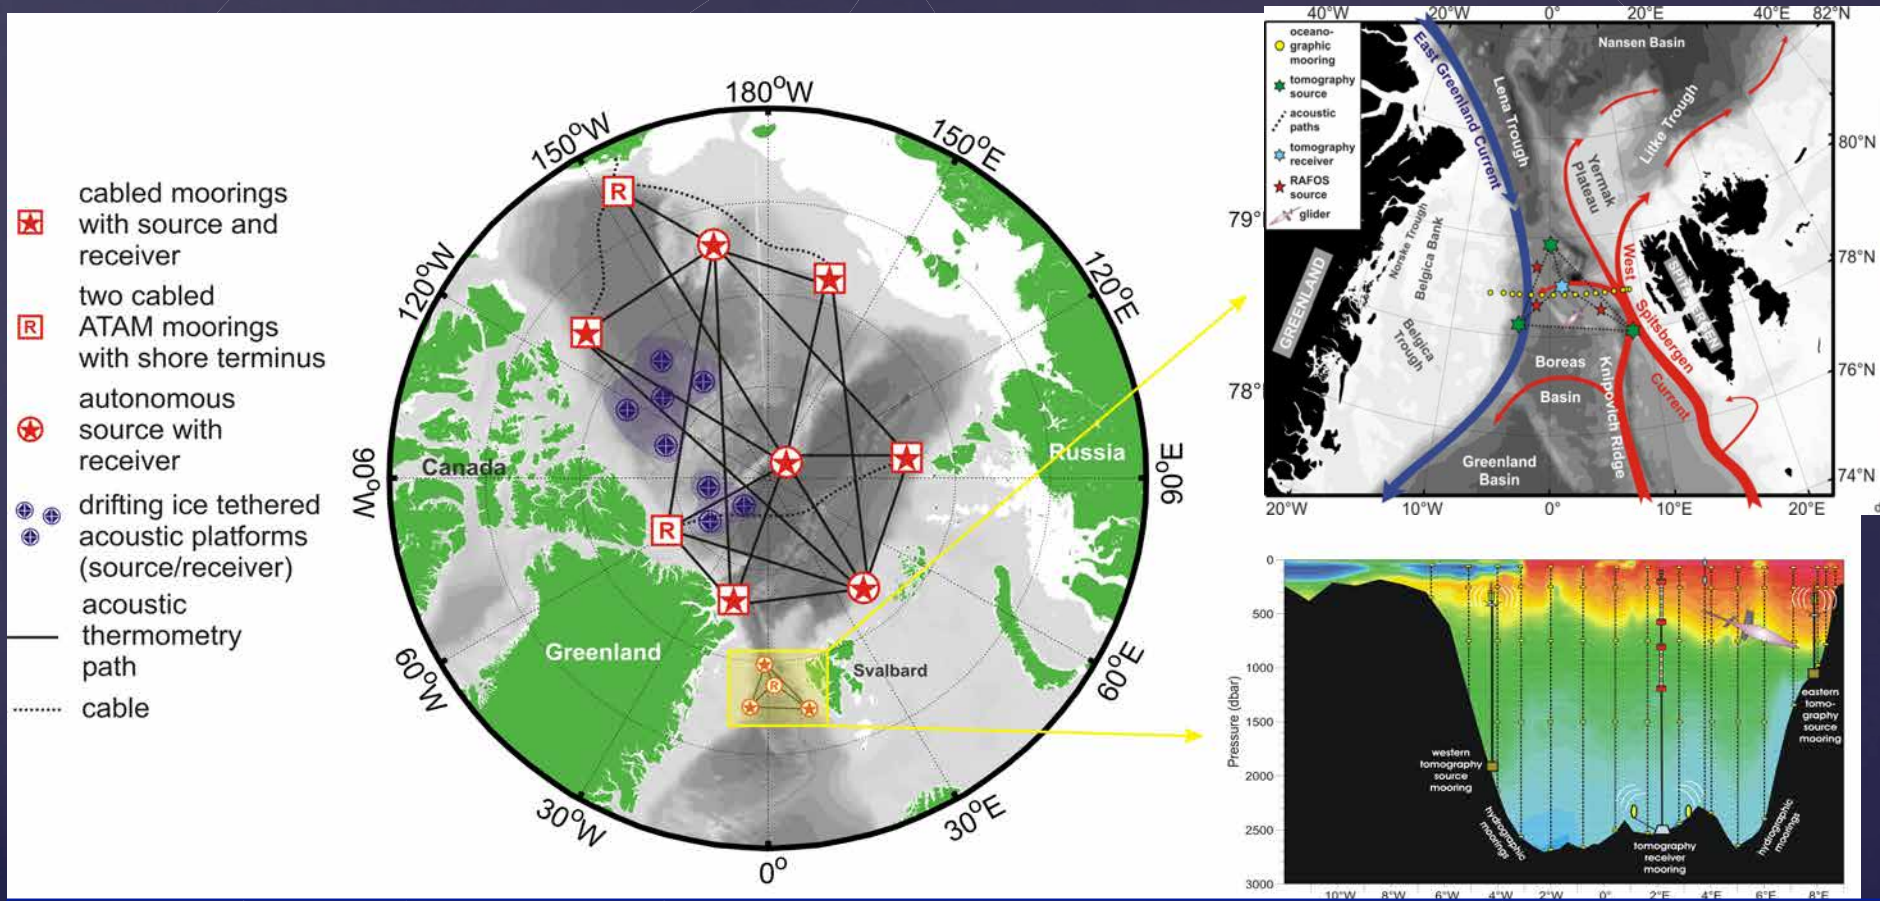

Dushaw, Sagen et al. in prep.

# Operational regional multipurpose acoustic monitoring system FRAM STRAIT – UNDER-ICE 2014-2016

# Multipurpose Acoustic Networks in the Integrated Arctic Ocean Observing System

A future underwater acoustic network – GPS for floats and gliders, listening system, and to measure averaged temperature and current. See Mikhalevsky, Sagen, Worcester et al. 2015

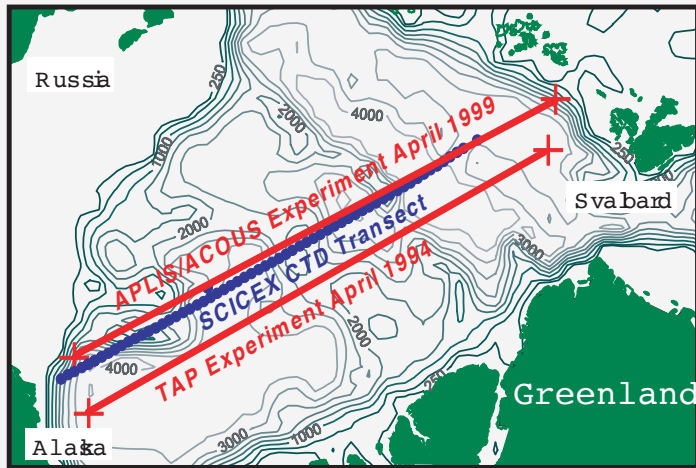

# ACOUSTIC THERMOMETRY in the ARCTIC OCEAN

**MAJOR ARCTIC OCEAN WATER MASSES ARE WELL SAMPLED BY ACOUSTIC MODES/RAYS (Modes shown for 20 Hz)**

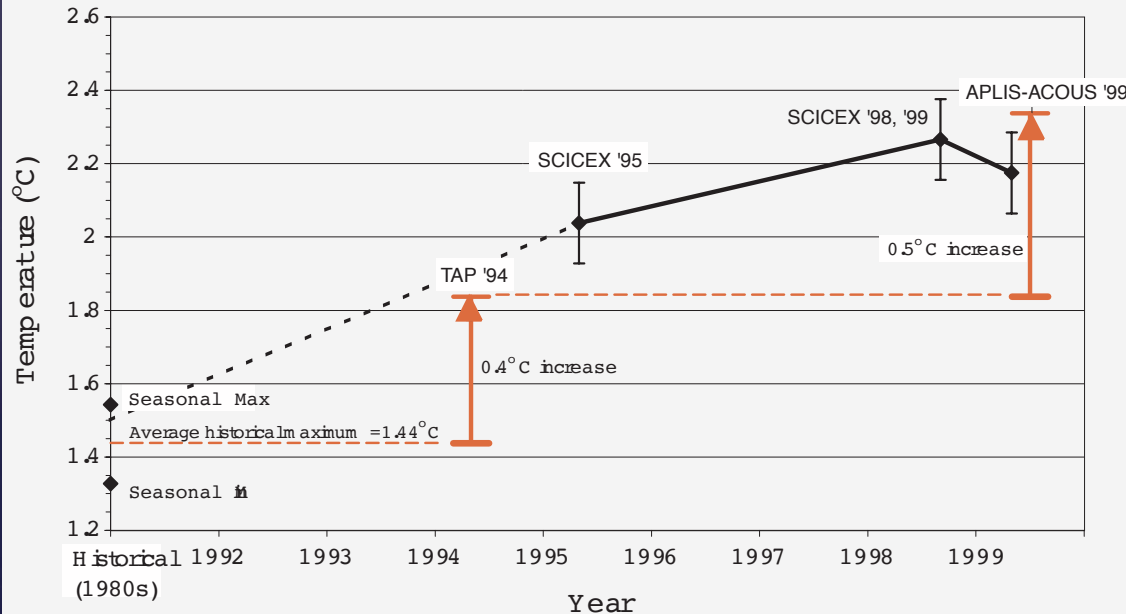

Mikhalevsky, 2001

# Trans Arctic experiment 1994-1999

Acoustic thermometry documented increased averaged ocean temperature in the Arctic.

This was confirmed by oceanographic section obtained during SCICEX

Mikhalevsky.  
Ocean Obs 99

**A regional multipurpose acoustic system has been and is operational in the Fram Strait. Acoustic thermometry have shown its strength in validation of ice ocean models**

**A new trans Arctic experiment will provide data to compare with measurements from 1994 and 1999. This will address the key question about temperature and heat content change in the Arctic Ocean interior over the last two decades.**

**Establish baseline measurements for validation and calibration of climate and ocean models to assess their capabilities to predict future climate both in the Arctic and on global scale.**
