1.0 Introduction

1.1 The University of Bath recognises the important role its trees provide in terms of landscape setting, amenity and nature conservation. Existing trees within the site already contribute significantly to a sense of place, they soften built form within the site, they provide screening from neighbouring properties and, being on rising ground, assist in maintaining the skyline of the Bath World Heritage site when viewed from a distance.

1.2 Trees, woodlands and hedges have intrinsic beauty and make a considerable contribution to the green infrastructure within the site. In addition, they provide wide ranging ancillary benefits in terms of air quality, shade, shelter, mental health, wildlife habitat and contribute in reducing or moderating the effects of climate change. They are a key element in maintaining, expanding and diversifying biodiversity. Nearly all benefits increase with tree age, subject to careful management.

1.3 The University recognises that trees have natural life expectancies which are potentially well in excess of built form within the site and, as such, require space both above and below ground if they are to reach their full design potential and to remain in a healthy and safe condition.

1.4 Trees drop leaves, seeds, flowers, bark and deadwood as part of their normal biological development. Site conditions, pest, disease and severe climatic events can result in unpredictable tree failure either in part or whole tree. Whilst large trees provide the greatest benefits, they also pose the greatest risk of harm to infrastructure and users of the campus should they fail.

1.5 The policy sets out the aims and objectives for tree management, provides standards for designing, selecting, installing and maintaining trees whilst complementing and supporting the University's other objectives in terms of landscape and infrastructure management.

1.6 The policy recognises that management of trees is only part of the estates management budget requirements. Budgets are constantly under review and are likely to be reduced in future decades. Tree Management will therefore be focused on achieving long term *best value* by ensuring trees are, as far as possible defect free, established and maintained to maturity.

1.7 The policy will set out how existing trees will be inspected and managed so as not to pose an unacceptable risk to staff, students, and visitors to the campus, neighbouring properties and adjacent highways. It provides a framework for how trees will be managed and replaced in a timely and sustainable manner.

1.8 The continuing success of Bath University requires ongoing expansion, maintenance and redevelopment of the site to ensure the facilities remain world class and relevant. It is recognised that such work places additional pressure on the remaining green infrastructure within the site. The policy will set out minimum standards to be followed when designing and implementing maintenance and development works where trees could be adversely impacted by construction and maintenance operations.

2.0 Current Situation

2.1 The University currently has no dedicated policy in relation to design, tree planting, after care and maintenance. Planting design and implementation has been mainly driven in response to planning applications for the continued improvement and development of the University infrastructure rather than identifying and meeting specific landscape, amenity or habitat requirements.

2.2 Much of the existing tree stock installed over the last 20-30 years has been installed at high density in limited space. Although established, it is now of moderate but declining quality often containing defects which are life limiting. Planting has often been installed in locations which are unsuitable for the selected species or which requires trees to be continually pruned if they are to reach maturity. Much recent planting has relied on high numbers of low-quality stock, installed in locations where long-term biological needs cannot be met. Species have been installed without consideration to their mature size and form, which in middle-age or maturity will result in conflict with university infrastructure or suppression of adjacent better-quality trees. This will result in the need for continual and ongoing maintenance or their premature removal long before normal life expectancy is reached.

2.3 Due to the large numbers of recently planted trees on site, aftercare has been limited to mainly essential works. This is at the expense of the development of appropriate defect-free trees which have a long life-expectancy.

2.4 The quality of stock and planting techniques has varied considerably over past decades. This has resulted in trees with significant defects being installed, which limits their long-term potential from the outset, or a lack of maintenance resulting in increasing damage as trees develop. Planting and support methods further contributed to reducing life expectancy.

2.5 After care of new planting has been limited due to the available trained resource and budgetary constraints. No, or limited, formative pruning, removal of tree supports or thinning (to favour the best specimens within groups and woodlands) has been carried out in a proactive and timely manner which has resulted in the early development of significant structural defects. Trees in high density groups and/or restricted locations, in many cases, have now outgrown their sites or are showing evidence of significant decline and or structural weakness. This will increase the risk of future failure, increase future management costs and result in a long-term decline in tree stock quality and life expectancy.

2.6 Table 1 below identifies the main strengths, weaknesses, opportunities and threats relating to the existing tree stock within the site.

Table 1. Strengths, Weaknesses, Opportunities and Threats

Campus Tree Stock	
Strengths	• Diverse and established tree stock. • Wide range of species and age class. • Established areas of mature woodland present. • Inspection and survey programme in operation. • Large scale site providing wider opportunities for long term management. • Veteran tree habitat.

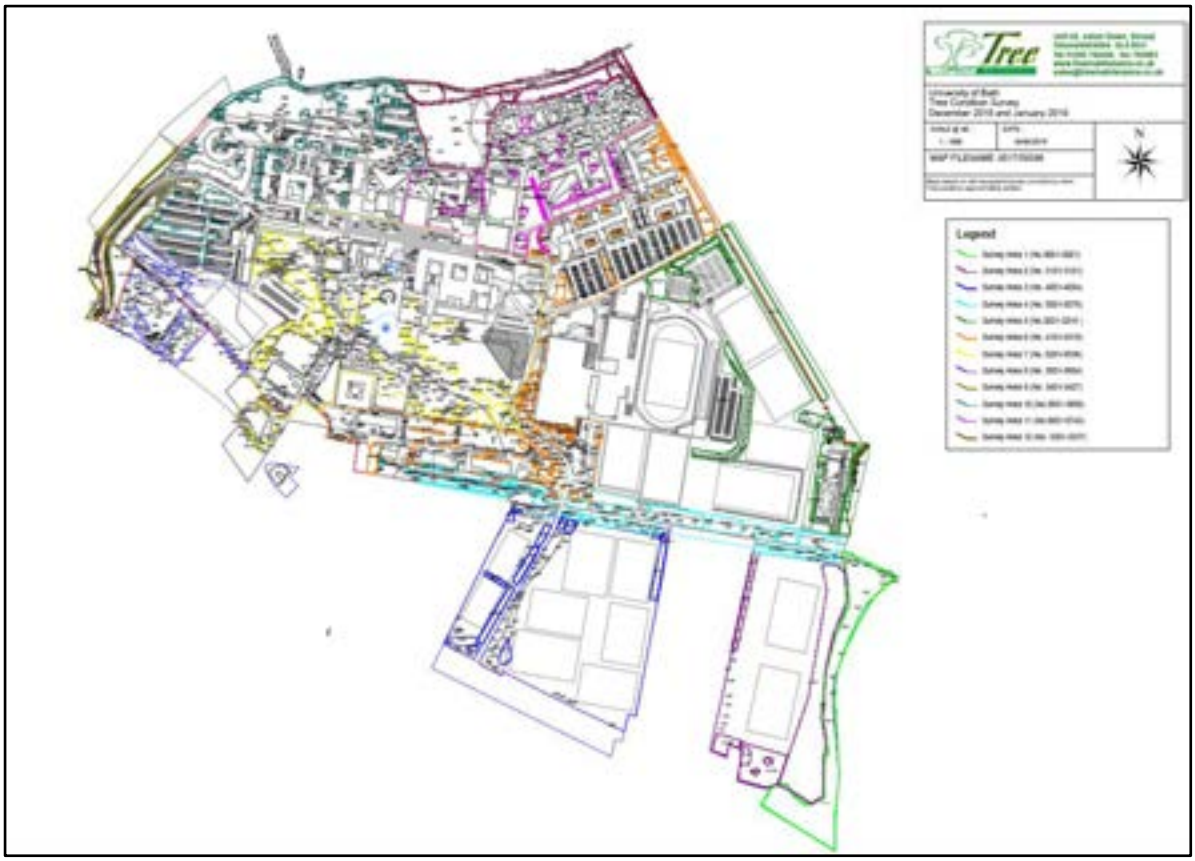
Weaknesses	• Finite space within site for planting. • Historic high-density planting. • Poor planting and maintenance practices. • Large numbers of young and middle-aged trees with life limiting structural defects due to lack of formative pruning. • Lack of sustained long-term plan for management of key arboreal feature. • Over mature Beech with the capacity to decline rapidly. • Limited in-house maintenance resource. • Limited number of grounds maintenance staff with arboricultural knowledge. • Lack of arboricultural engagement with staff and contractors. • Sensitive site on rising ground within a world heritage site. • Veteran tree habitat in decline with wide age gap to replacement trees. • Calcareous natural soil composition limiting species selection.
Opportunities	• Planting space developing due to loss of diseased or declining trees. • Wider understanding of environmental concerns in terms of climate change and biodiversity improvements. • Development of tree stock as an educational resource. • Planned planting of a reduced number of high-quality trees providing a long-term asset to university landscape. • On site recycling of green waste. • Engagement of local community and university faculties for tree development.
Threats	• Developing diseases including Ash Dieback, Larch Phytopthora and Sudden Oak decline impacting on existing tree stock. • Grey Squirrels on and adjacent to the site resulting in extensive damage to trees. • Calcareous natural soil composition impacting on health of existing tree stock. • Improvement and development of University infrastructure. • Maintenance and installation of service and existing infrastructure. • Ongoing reduction of future budgets for estate maintenance. • Application of inappropriate planning policy. • Climate change resulting in weather extremes making some species unsustainable for the future. • Short term event requirements impacting on long term tree population. • Reduction in biodiversity due to habitat loss

2.7 Disease and climate change will further increase pressures on the tree stock resulting in further tree loss and degradation of the tree cover in and around the site. Possibly the most significant being Ash Dieback due to the number of trees of these species on site, the speed at which the disease develops and the rapid degradation in wood quality.

2.8 The entire campus site was subject to a full tree survey in December 2018 and January 2019 (Tree Condition Survey 9517/59396 included at Appendix 1). The survey was provided in spread sheet format so that information and recommendations from future surveys can be added, and comments amended, to provide a continuous record of management.

2.9 The tree survey was carried out independently of any future proposals or policy development. The site was divided into twelve compartments of similar character (Figure 1 below).

Figure 1 Tree Location Plan and Survey Zones December 2018 and January 2019



2.10 Trees were surveyed either as individuals, groups or woodlands. The aim of the survey was to assess the health and condition and obtain an up-to-date overview of the tree stock at that time.

2.11 Individual trees were provided with a new tag to aid identification and provide a consecutive numbering system. Groups were not tagged but identified with 'G' and using a nearby individual tree number.

2.12 Works were prioritised by assigning a number of months from the date of survey in which works should be completed. The schedule requires dates to be inserted to show when works are completed and by whom, thereby providing an auditable and defensible system. A tree works contract was let in 2020 and works outlined in the survey schedules are being progressed.

2.13 Short, medium and long term management works were included where identifiable. These provide guidance on required works and for budget allocation reasons. This can be amended during future surveys to reflect evolving needs.

2.14 During 2018, a comprehensive review of the campus Tree Preservation Order was carried out in partnership with Bath and North East Somerset Council. This has resulted in revocation of the previous Tree Preservation Order which covered the University as an Area Designation (protecting many low value trees) and serving of the Bath and North East Somerset (University of Bath, Claverton Down, Bath. No. 317) Tree Preservation Order 2018. The order now covers 4 individual trees, 32 Groups and 23 woodland designations within the campus. A copy of the order is attached at Appendix 2. An extract of Tree Reservation Order Plan shown on the BANES web site is shown in figure 2 below

Figure 2. Extent of Tree Preservation Order

2.15 The University has revised the University Master Plan and the Landscape and Ecological Master Plan in order to reflect the changing requirements and character of the campus. These highlight areas of future development, and areas of landscape and ecological importance, which require further management and improvement if the benefits are to be retained and enhanced for future generations.

2.16 The University recognised that the historic Beech Avenue was in decline and required an agreed and consistent management approach and as such provided a Briefing Note in 2020 to Bath and North East Somerset Council (Appendix 3) setting out options for

the management and rejuvenation of the Avenue. Three options were proposed but no agreement between the Council's Tree, Landscape and Ecology officers could be reached. As management is required, the University has decided to gradually convert the avenue to mixed linear woodland as this provides the best opportunity to maintain a sustainable long-term feature.

3.0 Landscape Assessment

3.1 A full description of the landscape setting, amenity value and ecologically important areas is provided within section 2 of the revised Landscape and Ecological Master Plan (LEMP 2020). This divides the site into 13 character areas. The table below sets out the Tree Survey Zones in relation to the principal areas of the LEMP.

Table 2. Survey Zones and LEMP Character Areas Comparison Table.

Tree Survey Zone	Tree No	Principle Area (LEMP)
1	3001-3021	Southern Playing Field
2	3101-3121	Southern Playing Field
3	4001-4054	Southern Playing Fields and Norwood
4	5001-5076	The Avenue
5	3201-3215	Eastern Playing Fields & Eastern Boundary
6	4101-4318	Eastern Boundary
7	5201-5536	University Park, Arrivals Hub & Woodlands / North Road access
8	3501- 3604	South Western Boundary
9	3401-3427	Western Boundary / Quarry Road
10	3651-3850	Northern Boundary West
11	5601 – 5743	(Not listed – Student accommodation and Academic Core)
12	3301-3337	Northern Boundary East

3.2 In all cases, individual trees, groups of trees and woodlands form a significant element in each area identified. These either determine the internal character of the site and setting of the university or, within the wider landscape, soften and screen built form on or near the skyline especially when viewed from the Bath World Heritage Site and other wide ranging views.

4.0 Existing Tree Stock

4.1 As indicated, the site has been divided into twelve Survey Zones consisting of Individual Trees and Groups. The survey identified 1249 individual trees and 338 groups of trees across the site.

4.2 The campus contains a wide range of species both native and introduced. The full range of species is shown within the Survey Schedules. Many of the planted species are evergreen conifers which require acid soils and therefore genetically unsuitable to the natural calcareous soils within the site and so likely to continue to lose vitality as they mature.

4.3 Tables 1-12 below provide a breakdown the zone composition in regards age class, structural condition, physiological condition and quality grade.

Table 3 Zone 1 Composition

Zone 1 Composition							
Number of Individual Trees in Zone: 21							
Age Class	No	Physiological Condition	No.	Structural Condition	No.	Grade	No.
New Planting	0	Good	11	Good	11	A	0

4.4 From the above tables it is evident that there are only a very limited number of High 'A' grade trees on site. Most trees and tree groups are in the moderate to low quality grade. Without proactive management, trees and groups are likely to continue to decline impacting on the setting of the wider landscape and the University grounds and increasing future management costs.

4.5 New trees and young planting is limited in nearly all zones. Without management, and a small but continuous programme of replacement planting, a sustainable, balanced age structure cannot be achieved or maintained.

4.6 Due to the age of the University and previous developments there are a high number of semi mature and middle-aged trees. These trees are an important element of bridging the age gap between what is now planted, and the mature and over mature trees which are starting to decline. Although many contain structural defects and damage which is likely to be life limiting, with careful management they have the capacity to assist in maintaining tree cover whilst new, better-quality trees are planted and maintained.

4.7 There are a high proportion of trees with good physiological condition and good structural condition. These trees will be favoured as part of any thinning works where trees are capable of developing towards maturity without conflicting with existing University infrastructure.

5.0 Aims and Objectives

5.1 To maintain the existing tree stock in a sustainable way, balancing the reduction of risk to users of the site against the landscape setting, visual amenity and wildlife habitat.

5.2 To make the best use of available resources to establish, maintain and enhance tree cover within the site for future generations balanced against the developing needs of the University.

5.3 To fully consider the landscape, ecological, biological and maintenance requirements of all new planting in order that it can develop to maturity, meet design requirements, need minimal intervention and pose minimal risk to infrastructure and users of the site in the future.

5.4 To identify and provide suitable and sufficient resources to ensure trees are maintained in accordance with best practice and the latest standards from design to maturity.

5.5 Where possible, to provide and implement tree management and new planting in advance of proposed development, as shown on the revised master plan, to reinforce and improve boundary screening prior to construction.

5.6 To make provision for the identification, retention and protection of appropriate, good quality trees near to proposed development from initial concept through to final landscaping and occupation.

5.7 To develop arboricultural targets based on the quality of tree cover and longevity rather than the number of trees installed. The aim is to ensure trees can develop to maturity, provide a long-term asset to the site and to reduce long term management costs by early, proactive intervention.

5.8 To retain selected mature and over mature trees as veterans (or proto veterans) and to increase the number of trees within this age category. Identified trees will retain defects such as deadwood, cavities, broken limbs and decay pockets. Where access can be limited trees will be allowed (as far as reasonably possible) to decline naturally. Where access cannot be limited, trees will be reduced and managed using sympathetic veteranisation techniques.

5.9 To increase and retain deadwood within the site, particularly in woodlands and areas of limited access. Where possible, features such as trunks and limbs with cavities will be secured in adjacent trees to maintain habitat.

5.10 To manage woodlands to be as diverse as possible in terms of age class, condition and woodland structure. Where possible, manage woodlands to develop graduated edges and glades to diversify habitat and encourage biodiversity.

6.0 Inspection and Risk Management

6.1 Although the overall risk of harm from falling trees is very low, the University recognises that the campus is confined and has high intensity use in almost all areas. Trees are dynamic structures that can never be guaranteed 100% safe; even those in good condition can suffer occasional damage under only average weather conditions. This campus is in use throughout the year and in all weathers. In order to manage risk at an acceptable level the University operates a proactive survey and inspection strategy. Full inventory inspections (where all trees are recorded) will be carried as and when the previous/existing survey is deemed no longer fit for purpose due to significant tree loss or planting of new trees. This will normally occur approximately every 10-15 years.

6.2 The 2018 / 2019 survey was developed in discussion with Bath and North East Somerset Council's Tree Officer and was expanded to provide a wider, comprehensive assessment including a grading system. The system has considered the suitability to setting, site conditions and use, structural and physiological condition, potential for future growth, ultimate size and amenity value. It identifies key site constraints and also where conflicts exist or will develop in the future. Trees were recorded as individual trees, groups or woodlands. Their condition and any work required in the short, medium and long term was recorded where it could be readily identified.

6.3 Walkover/negative tree inspections (only recording defective trees) are carried out by qualified and experienced arboriculturalist with a minimum NVQ level 4 qualification and level 6 for detailed inspections of suspect trees. They will hold the LANTRA Professional Tree Inspection qualification. Surveys will be completed on an average 30-month basis to minimise risk of harm. This allows the trees to be inspected both within leaf and out of leaf when different characteristics can be assessed.

6.4 Ash Dieback (*Hymenoscyphus fraxineus*) is now endemic across the country and poses a significant risk to the Ash population on campus. It can kill young trees in a single seasons and mature trees within 5 years. Even at early stages of infection, wood quality is degraded rapidly making management using normal tree surgery methods impossible. All Ash on Campus will therefore be inspected annually in midsummer when infection is most easily assessed. Where found to be infected, trees will be programmed for removal before they reach the end of Health Class 2 (25-50% leaf loss).

6.5 In addition to the professional survey, grounds staff carry out a quick visual inspection of all of the trees following any heavy snow fall or storms which exceed Beaufort scale 7 Near Gale Force winds. This, along with general and ongoing observation, aims to quickly identify any hazards to users of the site which require immediate attention.

7.0 Standards

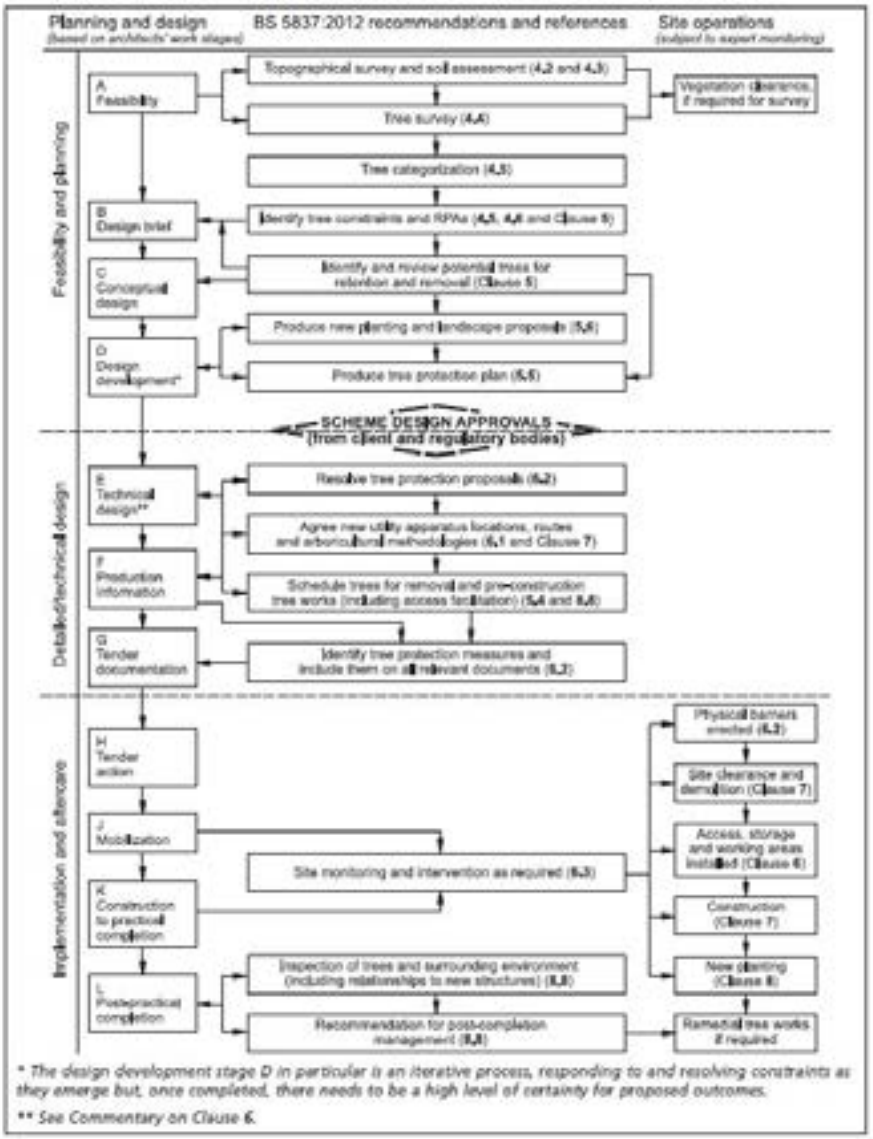
7.1 The University will manage its trees in accordance British Standards and Industry Best Practice as appropriate for development, tree works and planting and establishment.

7.2 New development, renovation and maintenance works will follow British Standard 5837 Trees in relation to design, demolition and construction – Recommendations 2012 (including subsequent revisions) whether works require Planning Approval. Development, construction, and maintenance works will follow the process set out in 'Figure 1 The design and Construction Process and Tree Care' (Figure 3 below) with the aim of minimising damage to existing and future trees which will reduce life expectancy and increase management costs.

7.3 New development, renovation and maintenance works close to retained trees or areas of proposed landscaping will be planned in consultation with a suitably qualified and experienced arboriculturalist. The arboriculturalist will assist in planning the works to minimise damage to trees together with monitoring and supervising works until completion.

Figure 3. Extract British Standard 5837 Trees in relation to design, demolition and construction – Recommendations 2012 'Figure 1 The design and Construction Process and Tree Care'

Figure 1 **The design and construction process and tree care**



7.4 Protection of soil resource is vitally important as poorly planned and executed stripping, storage and installation can significantly and detrimentally impact on tree establishment, growth and longevity for decades. As a minimum, soils will be handled and managed in accordance with BS 3882 Topsoil 2015 and DEFRA guidance Construction Code of Practice for Sustainable Use of Soils on Construction Sites 2009. Any imported soil will require a certificate of compliance from the soil supplier.

7.5 Although the tree policy aims to reduce the tree work requirements in the future, through careful design, planning, implementation and early intervention pruning, there will be a continued need for tree surgery works to be carried out. Poor quality and/or inappropriate works carried out by unskilled staff can significantly impact on the future health, condition and longevity of established trees. All tree works will therefore be carried out in accordance with British Standard 3998 Tree Work – Recommendations 2010 (including subsequent revisions).

7.6 All future planting of trees will be carefully considered to maximize the future landscape and ecological impact. It will consider, clearly state and record what planting is to achieve in the long term together with site conditions and the mature size and form of the tree/s and future management requirements. Trees will be installed only where they can reach full maturity and provide decades of benefits with only minimal intervention. Planting design, implementation and maintenance will follow and accord with British Standard 8545 Trees: from nursery to independence in the landscape – Recommendations 2014.

8.0 New Planting

8.1 The University will implement a continuous programme of new planting to ensure quality tree cover across the site is maintained and enhanced. The aim will be to provide a broad range of suitable species of diverse age which are free from significant, life-limiting structural defects. By developing a diverse tree population, it will be resilient to both pest and diseases and will moderate losses as a consequence of future climate change. It is recognised that in most cases, trees will live for several decades or even centuries and through many redevelopment cycles within the site. As such, trees require adequate space both above and below ground in which to develop if they are to reach maturity and fulfil their intended design potential.

8.2 Bath and North East Somerset Supplementary Planning Document - Planning Obligations April 2005 has been used in the past to force the planting of large numbers of trees when existing trees are removed as part of the planning and development process. The campus grounds are finite in terms of available space and suitable planting locations. This policy has resulted in high density, poor quality planting being installed in locations where it is never likely to reach maturity or meet any of its initial goals. In some cases, it has been detrimental to other biodiversity improvements such as species rich grass land or loss of graduated woodland edges. Planting has lacked short- and long-term maintenance due to ever increasing pressures on grounds maintenance staff which has resulted in further losses or development of trees with significant structural defects from an early age.

8.3 New planting will be planned to meet specific and identified needs such as visual amenity, screening, softening of built form, maintenance of skyline features, woodland development and continuous tree cover within the site, or for habitat and biodiversity improvement.

8.4 New planting will follow the guidance set out in British Standard 8545 Trees: from nursery to independence in the landscape – Recommendations 2014. This will ensure good quality, genetically suitable stock is installed and maintained until fully established. Sacrificial planting (nurse species) in areas identified for future development within the Master Plan will be avoided wherever possible so as to maximise resources for trees which are to be long term assets to the site.

8.5 When new planting is proposed, the University will appoint a suitably qualified arboriculturalist to undertake a full site assessment which will then lead the species selection and planting requirements.

8.6 All future planting proposals will consider the resource requirements necessary for trees to achieve independence with good structural form and space to develop.

8.7 New planting will be added to the tree survey once installed, together with listed and scheduled future works and completion dates.

9.0 Schedule of Works and Monitoring

9.1 Specific tree works for individual trees groups and woodlands are identified within the Tree Survey Schedules together with short, medium and long-term management proposals, where applicable. Broad management proposals are given in Table 15 below and follow the principal works areas within the Landscape and Ecological Management Plan.

Table 15. Prescribed works within the Defined Survey Zones

Zone 1
• Mixed aged woodland. • Young developing tree groups of high density require thinning. Formative prune remaining young trees. • Define compartments in larger mature woodland areas and instigate phased coppicing programme of understorey on a 10-15 year rotation. • Create glades within mature woodland to allow installation of succession planting and accommodate areas of unmanaged grassland. • Over mature beech in decline; remove selectively and install specimen trees to reinforce boundary. • Scallop and coppice woodland edge trees to form graduated woodland edge descending into grassland habitat. • High percentage of Ash along eastern boundary, both within and adjacent to site, prone to ash die-back. Remove as necessary to maintain safety and install replacement and succession planting to reinforce boundary as Ash decline develops.
Zone 2
• Mixed aged woodland. • Young developing tree groups of high density require thinning. Formative prune remaining young trees. • Over mature beech in decline; remove selectively and install specimen trees to reinforce boundary. • Scallop and coppice woodland edge trees to form graduated woodland edge descending into grassland habitat. • Install boundary planting along east side of sports field (adjacent to the dogs' home) to mitigate future loss of group 4001/3 Poplar.
Zone 3
• Potential for Larch to decline. • Thin conifer groups to remove suppressed and declining trees along drive access to create space for replacement planting of large native species and diverse understorey. • Install Silver Lime along eastern boundary to diversify age structure. Consider diversification of species to improve disease resilience. • Remove 'topped' trees from within tennis courts and install suitable replacements. • Incorporate management of Beech 4039-4042 into management regime for The Avenue to reduce risk of wind throw. • Install boundary planting along east side of sports field with dogs' home to mitigate future loss of group 4001/3 Poplar.

Zone 4
• High number of declining over mature Beech trees extensively decayed with history of large limb failure and collapse. Young trees extensively squirrel damaged and incapable of reaching full design potential. • Regular inspection of trees required. • Convert to linear woodland feature. Phased removal of over-mature Beech over a 20 year period; removing small groups where necessary to prevent wind throw and reducing adjacent trees to reduce the risk of failure in the short term. Select the best of the existing established planting for retention and formative prune.
Zone 5
• High density hedge planting along boundary becoming overgrown; lay hedge in sections to form secure barrier and to improve wildlife corridor. • Thin high density group planting along rear of accommodation blocks and bunds adjacent to car park by 40-60%; formative prune remaining trees. • High percentage of Ash within northern part showing evidence of Ash Die-back. Install replacement and succession planting to reinforce boundary as Ash decline develops. • Remove underground guying systems from around base of retained trees to prevent further constriction. • Divide understorey into compartments and instigate 10-15 year coppicing program. Maintain in perpetuity. • New planting extensively damaged by squirrels requiring pruning / removal and replacement.
Zone 6
• High density groups of young trees lining route, car park and front façade of STV. • Thin tree groups by 30-40 % to favour better specimens and formative prune remainder. • Maintain clearance to roads and parking areas. • High density hedge planting along boundary becoming overgrown; lay hedge in sections to form secure barrier and improve wildlife corridor. • Thin high density group planting along rear of accommodation blocks and bunds adjacent to car park by 40-60%; formative prune remaining trees. • High percentage of ash within northern part showing evidence of ash die-back. Install replacement and succession planting to reinforce boundary as Ash decline develops. • Remove underground guying systems from around base of retained trees to prevent further constriction. • Divide understorey into compartments and instigate 10-15 year coppicing program. Maintain into perpetuity. • New planting extensively damaged by squirrels requiring pruning / removal and replacement.
Zone 7
• Retain Poplars within tree group 5452/G3, with historic history of wind throw due to limited soil depth which restricts rooting environment. These Poplars support a colony of Hornet Clearwing moths. Reduce crown height to 7 metre pollards and maintain every 2-3 years. • De-compact area near 5452/G3 and install succession planting of Poplar. • Larch and Ash likely to decline; develop proposals for their phased replacement. • High density planting throughout area and around periphery requiring thinning/removal of unsuitable species and to provide space for high quality specimen succession planting (consider possible diversification through memorial dedication scheme). • Formative prune remaining trees. • Reduction of Beech to provide 2 metres clearance of building line 2S. Crown lift to improve light to lower windows. Maintain every three years. • Remove and replace declining trees. • Install succession planting along southern boundary within 2S car park.

Zone 8
• Seek formal consent to fell conifers adjoining Butley Ash (as agreed with adjoining house holder) – part of TPO W5. (3501G4). • Implement orchard planting within grounds of Medical Centre to rejuvenate existing declining orchard. • Thin high-density tree groups, formative prune remaining trees, remove poor quality and extensively damaged trees to create planting space. • Install high quality succession planting. • Divide poor quality understorey areas into compartments and instigate phased coppicing programme.
Zone 9
• Thin dense groups by 30-50%. Formative prune remaining trees. • Install and maintain succession planting within suitable gaps using large native species to reinforce boundary and skyline trees. • Divide poor quality understorey areas into compartments and instigate phased coppicing programme; reinforce with under storey planting to improve low level screening. • Instigate cyclic management of ivy. • Remove trees and shrubs from SSSI geological site to prevent deterioration.
Zone 10
• High percentage of Ash within northern boundary showing evidence of die-back. • Larch close to Polden in decline requiring removal and replacement with native succession planting. • Install replacement and succession planting to reinforce boundary as Ash decline. • Divide understorey into compartments and instigate 10-15 year coppicing program in perpetuity
Zone 11
• No prescribed works within LEMP for core Area • Thin groups by 30-40%; formative prune remaining trees • Review use of areas around infrastructure; design and install suitable succession planting. • Remove trees which significantly impact on infrastructure or have outgrown restricted locations. • Formative prune existing trees with potential good longevity to minimise structural weakness.
Zone 12
• Manage trees to avoid conflicts with adjacent buildings by creating graduated woodland edge and diverse understorey. • High percentage of Ash within northern boundary showing evidence of Ash Die-back. • Install replacement and succession planting to reinforce boundary as ash decline. • Divide understorey into compartments and instigate 10-15 year coppicing program in perpetuity. • Natural regeneration of Sycamore and planted Oak, Maple and Beech extensively damaged by squirrels. • Clear back and scallop woodland edge to rear of accommodation blocks to provide diverse and graduated woodland edge. • Remove over-bearing conifers located close to north side of buildings in north eastern part and create more appropriate natural edge. • High density hedge planting along boundary becoming overgrown; lay hedge in sections to form secure barrier and improve wildlife corridor. • Thin high density group planting along rear of accommodation blocks and bunds adjacent to car park by 40-60%; formative prune remaining trees. • High percentage of ash within northern part showing evidence of ash die-back. Install replacement and succession planting to reinforce boundary as ash decline develops. • Remove underground guying systems from around base of retained trees to prevent further constriction. • Divide understorey into compartments and instigate 10–15-year coppicing program. Maintain into perpetuity. New planting extensively damaged by squirrels requiring pruning / removal and replacement.

9.2 Works to individual trees and groups will be recorded within the tree schedule and will be the responsibility of the appointed contractor. This will include the names of personnel completing the works and dates when they were completed.

9.3 New planting will be added to the schedule at the time of installation together with required management works as indicated in planting design schedule included at appendix 4.

9.4 The University will appoint a suitably qualified consultant or staff member to check and sign off completed works ensuring they are to the required standards and specification.

10.0 Budget and Resource Allocation

10.1 The University recognises that the survey and management of its tree stock requires specialist skills and extensive resources not available in-house at the University. The University will therefore appoint external contractors to undertake survey and tree works, in line with public sector procurement rules, this contract will have to be re-tendered periodically, with each contract running for between 3 – 5 years.

10.2 The University has now included maintenance within the long-term maintenance strategy allocating budgets for tree planting, care and maintenance for the period of the contract works.

10.3 Projects requiring arboricultural input outside normal maintenance works will be directly supported from within the project budget and will include all elements from conception to completion.

11.0 Revision and Review

11.1 The policy is will run from 2021-2041 and although a rolling policy it will be fully reviewed and amended at this stage.

11.2 However, the progress and development of the tree stock requires monitoring of results on a on a more regular basis. Results will be reviewed every 5-6 years by an independent external consultant following the resurvey of the tree stock. This will allow design objectives, new planting, tree quality and maintenance schedules to be assessed. These periodic checks will identify whether shortfalls are developing so that timely and appropriate action can be taken. The policy should include review dates which will provide a check of existing actions against the policy objectives.

1.0 Summary

1.1 All trees within the University of Bath Claverton Down Campus were subject to a ground level condition and safety inspection during December 2018 and January and February 2019. Inspection works were carried out by qualified and experienced arboriculturalists. All trees were inspected and recorded within the attached schedules and were plotted on a tree location plan of which the base was provided by the University.

1.2 The tree stock consists of a broad mix of species including both native and introduced exotics. The majority of the trees are young to middle-aged having been planted on an ongoing basis from development of the University in the 1960s through to the present day. There are a large number of inappropriately planted trees and high density groups which require either extensive thinning or removal and replacement as part of the wider Landscape Ecological Master Plan (LEMP) and evolving Tree Policy (TP).

1.3 Some boundary woodlands, together with Zone 4, contain large over mature trees (mainly Beech). These are in a state of gradual decline and require further investigation and more frequent careful inspection and management if they are to be retained in a healthy and safe condition in the short term.

1.4 Overall, the tree stock campus is considered to be in fair condition given the ground conditions, spread of species, ages, and past management. The tree stock has the capacity to improve, subject to committed future management, but will decline if it is not identified and managed as an important capital asset to the University. Required future management includes: removal of supports (stakes and ground anchor systems); formative pruning of young trees; thinning of groups; careful planning; installation and maintenance of appropriate young trees and the frequent inspection and implementation of works to the mature tree stock.

1.5 It has been confirmed by Bath and North East Somerset Council that trees within the site are protected by a Tree Preservation Order (TPO) and some are located within a Conservation Area (CA). A new site wide Tree Preservation Order has recently been served and confirmed. Previous Orders are to be revoked but until this is has been completed it should be considered that all trees are protected. Although some works are exempt from the need for consent, I recommend that the whole schedule and tree location plan are attached to the application/notification to the Local Planning Authority before works are carried out - with the exception of investigation works within Zone 4 which should be completed at the earliest opportunity.

1.6 Failure to obtain written consent/give notification is a criminal offence and could result in a fine of up to £20’000 on summary conviction, unlimited fine if indicted to crown court and/or 6 months in prison.

1.7 Birds, Badgers and Bats are protected under UK and European Law from disturbance and harm. Where work is being carried out and birds, badgers and bats are present, consultation must be made with the Statutory Nature Conservation Organisation, Natural England 0845 6003078 www.naturalengland.org.uk. Work likely to disturb nesting birds should be avoided from late March to August.

1.8 One thousand two hundred and forty nine (1249) individual trees and three hundred and thirty groups (330) were surveyed. There are thirty three (33) High quality 'A' grade individual trees and three groups. There are seven hundred and twenty eight (728) moderate 'B' grade trees and one hundred and sixty one (161) groups. There were four hundred and fifty four (454) low quality 'C' grade trees and one hundred and sixty one (161) groups. Within the survey there are thirty four (34) trees and five (5) groups which are categorised as 'U' and having a life expectancy not exceeding 10 years.

1.9 Priority times for recommended works are listed below. One tree and one group of trees is recommended for work within 1 month as they contain significant defects which require urgent attention.

1.10 Thirty eight (38) trees and ten (10) groups, although not imminently dangerous, require attention within 3 months of date of survey.

1.11 Two hundred and twenty seven (227) trees and fifty (50) groups require works within six months whilst a further five (5) trees are recommended for works within 9 months.

1.12 There are two hundred and forty one (241) individual trees and seventy four (74) groups requiring work within one year

1.13 Sixty five (65) trees are recommended for works within 18 months with another fifty eight (58) needing works as budgets allow.

1.14 There are thirteen (13) groups requiring work within 2-3 years and a further twenty nine (29) requiring works as budgets allow.

2.0 Introduction

2.1 I am Ken Sheppard, the senior Arboricultural Consultant with Tree Maintenance Limited. I have 33 years' experience in arboriculture and urban tree management; I am a Fellow of the Arboricultural Association and a Chartered Arboriculturalist through the Institute of Chartered Foresters. I am also a qualified Professional Tree Inspector as assessed by the industry lead body Lantra.

2.2 I have been assisted with the survey by Martin Jenkins and Nick Organ, both consultants for Tree Maintenance Ltd. Martin Jenkins has been involved in the care of amenity trees since 1992. He holds the National Certificate in Arboriculture (NCH) and Technician's Certificate in Arboriculture (Arboricultural Association) and is a qualified Professional Tree Inspector. Nick Organ has been involved in the care of amenity trees since 1985, he holds the Technician's Certificate in Arboriculture (Arboricultural Association) and is a qualified Professional Tree Inspector.

2.3 In accordance with our estimate dated the 13th September 2018, I have been instructed by Mr S Godber, Director of Estates Operations, University of Bath to carry out a survey of all trees within the Claverton Down Campus defined by the red boundary line on the plan provided.

2.4 I have been instructed to inspect all trees within the campus boundary and provide a condition assessment and safety report together with future management recommendations where appropriate. All individual trees, groups of trees and woodlands have been inspected, and recorded within the schedules provided. Trees have been numbered with a rectangular steel tag and are indicatively plotted on the base plan provided to create Tree Location Plan 9517/59396.

3.0 Method and Abbreviations

3.1 The site visits were carried between December 2018 and February 2019. The visits were unaccompanied but with informal meetings and discussions with University staff throughout the period.

3.2 Trees have been visually inspected from ground level using binoculars where necessary. A system of Visual Tree Assessment (VTA) has been used to assess both the physiological and structural condition of the trees. No detailed inspection of suspected defects has been carried out and where this is considered necessary it will be detailed in the recommendations.

3.3 The site has been divided into the 12 survey areas to allow resurvey works to be phased and completed as appropriate to the level of risk. All individual trees have been numbered with a rectangular steel tag installed at around 1.8 metres where access permitted. Historic tree numbers are included on the schedule, where available, to provide a continuous record of inspection and easy reference to previous reports. Survey area tag numbers are shown in Figure 1:

Figure 1. Survey area tag numbers

Survey Area 1 (No.3001-3021)

Survey Area 2 (No. 3101-3121)

Survey Area 3 (No. 4001-4054)

Survey Area 4 (No. 5001-5076)

Survey Area 5 (No.3201-3215)

Survey area 6 (No. 4101-4318)

Survey Area 7 (5201-5536)

Survey Area 8 (No. 3501-3604)

Survey Area 9 (No. 3401-3427)

Survey Area 10 (No.3651-3850)

Survey Area 11 (No.5601-5743)

Survey Area 12 (No. 3301-3337)

Additional tags have been passed to the estates department so that future plantings can be sequentially tagged when installed and added to the zone schedule.

3.4 Groups and woodlands are assigned the number of the closest individual tree followed by a / and a figure or G and a figure, for example 4001/1 or 5001G1 or 5070/G1. Tree positions are shown on the Tree Location Plan 9517/59396 provided.

3.5 Both common and botanical names are given for individual trees, only common names are given for first five principal trees within the groups. The number of trees of each species within a group is also provided to aid future management.

3.6 Codes used are as follows:

3.6.1 Age Class:

Age Classification is a best predicted assessment considering the tree species together with its current environment:

NP	**New Planting**	Recently planted young trees capable of easy relocation.
Y	**Young**	Recently planted trees at less than ¼ life expectancy.
SM	**Semi Mature**	Established trees at less than ⅓ predicted life expectancy.
MA	**Early Mature**	Trees between ⅓ and ⅔ predicted life expectancy.
M	**Mature**	Trees over ⅔ predicted life expectancy.
D	**Dead**	Trees which have little or no functioning networks of living cells.

3.6.2 Legal Protection:

Given, if known whether trees are protected by a Tree Preservation Order or located within a Conservation area, otherwise None, as below.

None	None known at time of survey
TPO (E)	Tree Preservation Order Existing
TPO (P)	Tree Preservation Order Proposed
CA	Within Conservation Area

This will require revision following the confirmation of the new site wide preservation order and revocation of the existing orders, expected by May 2019.

3.6.3 Size Class:

L	**Large**	Trees 20+ metres tall
M	**Medium**	Trees 10-20metres tall
S	**Small**	Trees <10 metres tall

3.6.4 No of Stems

Shown in brackets. Denotes the number of stems developing from ground or near ground level.

3.6.5 Physiological Condition

Physiological Condition is an assessment of the tree's overall health (ability to resist Strain) which affects its ability to tolerate changes such as climate, local environment and colonisation by pests and diseases. The assessment is based on bud density and distribution, leaf size and colour, crown density, annual extension and wound closure compared with similar species within the locality:

G	**Good**	A tree with a fully functioning biological system showing evidence of normal sustained growth.
F	**Fair**	A tree with fully functioning biological system showing some evidence of continuing growth which has the potential to improve or decline depending on environmental conditions and future management.
P	**Poor**	A tree with a biological system of limited functionality and declining health, unlikely to recover but which may remain in a moribund state for a significant period of time.
D	**Dead**	A tree which lacks any significant live tissue or functioning biological systems.

3.6.6 Structural Condition:

This relates to the physical condition of a tree including its roots, trunk, branch unions and limbs. It is an overall assessment of bio mechanical strength based on visible defects or defect indicators identified at the time of the survey:

G	**Good**	No significant structural defects
F	**Fair**	Structural defects which can be improved or remove through moderate remedial tree surgery or other management practices
P	**Poor**	Significant structural defects which cannot be alleviated through moderate tree surgery or other management practices

3.6.7 Potential for Future Growth

This is assessed and estimated in relation to the approximate dimensions of a particular species within a particular setting or environment.

L	**Low**	Almost fully grown for species.
M	**Moderate**	Likely to double in size before maturity.
H	**High**	Likely to more than quadruple in size before maturity.

3.7 Observations:

Notes regarding the general location, condition and relevant defects within a tree which may or may not require further works or investigation.

3.8 Recommendations:

These are based on an assessment of risk (the likelihood of harm occurring), the size of the hazard (anything with the potential to cause harm), the value of the target (persons or property that could be injured or damaged), and the frequency of occupation. The targets to be considered here are:

- Residents and visitors to the University
- Employees and visitors to the University
- Students
- Users of footpaths across and adjacent to the site
- Buildings and infrastructure within the site
- Neighbouring residential properties and golf course

In the first instance, works are prioritised for reasons of safety followed by works required for reasons of good management in the short term (1-3 years) and can include clearance of services, signage and buildings, to improve the growth of the tree or minimise future maintenance costs.

3.9 Prioritisation of works:

These are given in terms of months from the date of survey. Recommend works should be completed within the specified time frame if a defensible system is to be maintained. Works have been prioritised based on the level of risk they pose.

3.10 Man Days:

This is an estimate of the time a particular recommendation/operation will take and does not include mobilisation to site. Where extensive works are proposed, a 10+ indicator is given as these elements are sufficiently large as to require individual pricing at the time of quoting.

3.11 Grade:

A grade system has been given to provide guidance as to the life expectancy and value a particular individual or group of trees provides. It is in accordance with British Standard 5837 Trees in relation to design, demolition and construction – recommendations 2012

and is a well-recognised and understood system. The grades are A, B, C, and U with sub grades 1-3 indicating particular merits. Sub grades 1-3 do not infer greater value but differentiate particular values. A description of the grades is listed in table 2 below. When considering future works efforts should be made to retain the high and moderate grade trees over those of lesser value and life expectancy.

Figure 2. Tree Grading.

Category and identification Colour on plan	**1. Mainly arboricultural values**	**2. Mainly landscape values**	**3. Mainly cultural values**
U (red)			
Trees of such a condition that they cannot be realistically retained as living trees in the context of the current land use for longer than 10 years	• Trees that have serious, irremediable, structural defect, such that their early loss is expected due to collapse including those which will become unviable after the removal of other category U trees (where for whatever reason, the loss of companion shelter cannot be mitigated by pruning) • Trees that are dead or are showing signs of significant, immediate, and irreversible overall decline • Trees infected with pathogens of significance to health and/or safety of other trees nearby, or very low quality trees suppressing adjacent trees of better quality *Note Category U trees can have existing or potential conservation value which might be desirable to preserve*		
A (green)			
Trees of high quality with an estimated life expectancy of at least 40 years	Trees that are a particularly good example of their species, especially if rare or unusual, essential components of groups or of formal or semi-formal features (e.g. the dominant or principle trees within an avenue)	Trees, groups or woodlands of particular visual importance as arboricultural or landscape features	Trees, groups of trees or woodlands of significant conservation, historical or other value (e.g. veteran or wood pasture
B (blue)			
Trees of moderate quality with a remaining life expectancy of at least 20 Years	Trees which may be in the A category but are downgraded due to their impaired condition (e.g. presence of significant though remediable defects, including unsympathetic past management and storm damage), such they are unlikely to be suitable for retention for beyond 40 years; trees lacking the special quality necessary to merit category A designation	Trees that are in numbers, usually growing as groups or woodlands, such that they attract a higher collective rating than they might as individuals; or trees occurring as collectives but situated so as to make little visual contribution to the wider locality.	Trees with material identifiable conservation or other cultural benefits
C (grey)			
Trees of low quality with an estimated life expectancy of at least 10 years, or young trees with a stem diameter below 150mm	Unremarkable trees of very limited merit or such impaired condition that they do not qualify in higher categories	Trees present in groups or woodlands, but without this conferring on them any greater collective landscape value ; and/or trees offering low or only temporary /transient landscape benefits	Trees with no material conservation or other cultural value

3.12 Future Management:

Where appropriate short, medium and long term management has been proposed to assist in the development of the tree stock. This will be amended and added to during future inspections and as use changes in areas around existing trees. Recommended time frames provide guidance on the maximum time any particular item should be completed within. Works could be completed earlier where budgets allow.

4.0 Discussion

4.1 As expected, as the trees have not been re-inspected in accordance with previous recommendations, trees of greatest concern are those located within zone 4. These are mainly over mature Beech and several require a climbing inspection, detailed decay investigation and or imminent works if they are to be retained in an acceptable condition. These include: 5002, 5007,5010, 5017, 5018, 2023, 5024, 5026, 5028, 5030, 5038, 5040, 5044, 5047, 5049, 5039, 5052, 5054, 5055, 5056,5059, 5060, 5068, 5069, 5070, 5071, 5072.

4.2 Grey squirrels remain a problem within and adjacent to the site. This has resulted in wide spread damage to thin barked species such as Beech, Maple and Hornbeam across the site resulting in declining form, increased risk of branch/trunk failure, reduced vitality and wounds which are prone to colonisation by wood decay fungi. Control measures were implemented during 2018 and I recommend that this is continued into perpetuity between April and July as areas will be rapidly recolonised by groups beyond the site boundary as numbers within the site fall. Ideally, populations should be kept at below damaging levels not exceeding 5 per hectare.

4.3 Trees mainly within woodland areas are heavily colonised by ivy which limits their inspection. Ivy has ecological benefit, in particular as a late nectar source and habitat for insects and as a nesting or roosting site for birds and bats. It is non-parasitic, only using the tree for support and to reach the light. However, when extensive it can become disadvantageous to the tree by displacing foliage, preventing new shoots arising (making a ‘hollow’ crown), masking defects thereby preventing a proper inspection and by adding wind load. Where considered necessary it is been recommended for removal (or severing at the base, after which it will die off) to reduce the wind loading and to allow a more complete inspection the next time the tree stock is surveyed.

4.4 Where trees are free from observable defects, or in areas of low occupancy, ivy can be left. In areas with higher occupation rates I would recommend a rolling programme of Ivy severing, at least where well extended into the crown, so as to allow periodic inspection.

4.5 Much of the more recent planting within survey area/ zones 6 and 11 was installed using ground anchors and galvanised netting strips to spread the load of the tensioning guy wires over the root ball. These have, in many cases, become buried or partially buried and so have not been removed and this has resulted in constriction around the base of the trees. If not removed these will continue to cause constriction and will result in reduced vitality and the early demise of the trees. Root crowns require careful excavation and removal of as much of the wire material as possible without causing further damage to the trunk base.

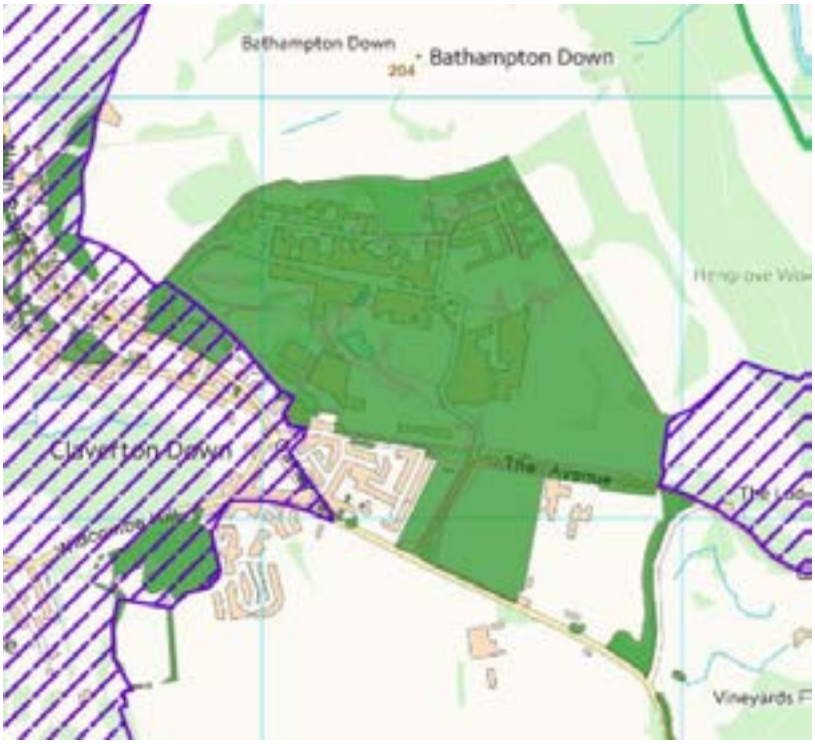
4.6 Young groups of trees have been established across the site either has shelter belts or amenity features. Now established, these are becoming dense resulting in the suppression and disfigurement of better quality trees and with most of the trees becoming tall and thin. Thinning of groups has previously been advised and this is now becoming imperative if successful long term development of the tree groups is to be achieved. Groups should be thinned at the earliest opportunity on a 5-8 year cycle until final spacing is achieved. Coppicing and under planting could be considered to maintain low level density, diversify the habitat and assist in developing a multi layered environment.

4.7 As stated in the previous paragraph, extensive planting has been carried out across the site since its original construction and through many reiterations and additions with varying degrees of success. I recommend that all future new planting is now carefully considered. As trees have a life expectancy well in excess of even new buildings, care should be given to the mature size of any tree planted, its final design goals and how these can be fully achieved from the outset. Full consideration should be given to the planting pit design, stock selection, installation method, maintenance and aftercare.

5.0 Planning Considerations

5.1 It has been confirmed by bath and North East Somerset Council (https://isharemaps.bathnes.gov.uk/atMyCouncil.aspx?MapSource=BathNES/banes&StartEasting=377067&StartNorthing=164734&StartZoom=250) that trees within the site are protected by City of Bath (University Of Bath) Tree Preservation Order 1995 and that the south western entrance is located within a Conservation Area. (Extract of Plannng Constraints Map. Figure 3 Below). Purple Hatch indicates Conservation Areas, solid medium green identifies Tree Preservation Orders

Figure 3. Existing TPO and Conservation Area Plan



5.2 Although some works are exempt from the need for consent, I recommend that this report

and plan is attached to the application/notification to the Local Planning Authority.

5.3 Due to the Tree Preservation Order, all work should be the subject of a formal application to the Local Planning Authority and there could be a consequent delay of up to 6 – 8 weeks before clearance.

5.4 Any pruning or felling of trees within a Conservation Area requires a 6 week notification to the Local Planning Authority. The Local Planning Authority may then allow this or impose some tree protection as part of the planning process, either as a 'condition of planning' or by the placement of a TPO.

5.5 Consents to carry out works to protected trees are valid for a period of 2 years from date of LPA approval.

5.6 A revised Tree Preservation Order has been produced for the site (Bath and North East Somerset Council (University of Bath, Claverton Down, Bath. No. 317)) Tree Preservation Order 2018 has now been served and confirmed. The previous order is planned to be revoked in the near future.

6.0 Wildlife Issues

6.1 Bats. Under current legislation it is an offence to 'intentionally or recklessly disturb a bat' or 'damage, destroy or block access to the resting place of any bat' (Countryside and Rights of Way Act 2001 and further strengthened by other legislation). Where work is being carried out and bats are present, or if the tree is a known roost, consultation must be made with the Statutory Nature Conservation Organisation Natural England 0845 6003078 www.naturalengland.org.uk. A European Protected Species Habitat Regulations Licence is likely to be required. Work to trees with the potential for roosting bats is best done from late August to early October. March through to April is also suitable although this may conflict with nesting birds (see below).

6.2 Birds. It is an offence under section 1 of The Wildlife and Countryside Act 1981 (as amended) to kill, injure or take any wild bird; intentionally or recklessly disturb any wild bird or take, damage or destroy the nest of any wild bird while it is in use or being built. Therefore work likely to disturb nesting birds should be avoided from late March to August.

6.3 Badgers are protected by the Protection of Badgers Act 1992. Under this Act it is an offence to wilfully kill, injure or take a badger, to interfere with a sett by damaging or obstructing it or by disturbing a badger when it is occupying a sett. Operations creating continuous vibration and noise should not be carried out 20 metres of any sett entrance. If works are to occur closer than 20 metres a licence from the Statutory Nature Conservation Organisation Natural England 0845 6003078 www.naturalengland.org.uk will be required.

6.4 All trees requiring work should be evaluated prior to work starting as part of a normal on-site risk assessment. If bird, badger or bat issues are suspected, then the tree works will be suspended and further advice should be sought from our office.

7.0 Arboricultural Methods

7.1 All tree work should be carried out to the highest standards, based on British Standard 3998:2010 '*Recommendations for Tree Work'* and current best practice.

7.2 The pruning of some species should avoid specific times. *Prunus* species (eg flowering and fruiting Cherry, Plum, Almond etc) should only be pruned during June – August in order to minimise the risk of infection by Silver Leaf disease. *Acer* (Maples including Sycamore), *Betula* (Birches) and, *Morus* (Mulberry) should not be pruned February – June due to sap bleeding; also *Juglans* (Walnut) from December – June. The trimming of most conifers and other evergreens should avoid the frosty winter months.

7.3 To ensure standards are met it is recommended that a contractor from the Approved List of the Arboricultural Association be used (01242 522152 www.trees.org.uk). A risk assessment and suitable method statement should be provided to ensure works are carried out in a safe manner.

8.0 Limitations

8.1 This report is an assessment of the physiological and structural condition of the trees at the time they were inspected. I am only able to provide an assessment of visual evidence available at the time. Observations are valid on the day of the inspection and recommendations and time scales are limited to a two year period. Similarly, this report could be invalidated if recommendations are not completed within the specified time limits or alterations are made to the site that could change the conditions as seen at time of inspection.

8.2 Under certain circumstances, roots can affect foundations, drains and other underground services. Assessment of these factors usually requires engineering and geotechnical input for a full assessment to be made. At this stage I have not been instructed to consider theses points which are therefore beyond the scope of this report.

8.3 Trees are dynamic structures that can never be guaranteed 100% safe; even those in good condition can suffer occasional damage under only average weather conditions. A lack of recommended work does not imply that a tree will never suffer damage.

9.0 Re-inspection

9.1 For a site like this where tree safety is of paramount importance, I recommend professional inspection is completed at not more than 2 year intervals. Inspections at 18 months can in fact be useful as this allows the inspection to alternate between the trees being in leaf and out of leaf as different information can be evaluated. Trees within Survey Area/Zone 4 should be inspected at least annually due to their declining condition.

9.2 As set out in section 8.0, even healthy trees can be subject to damage as a result of even moderate weather conditions. I would therefore recommend that in addition to the regular professional your grounds staff carryout a quick visual inspection of all of the trees following any heavy snow fall or storms which exceed Beaufort scale 7 Near Gale force winds. This should quickly identify any hazards to users of the site which require immediate attention.

10.0 Costs for Recommended Works

10.1 Costs can be given in due course if required, however this report is a stand-alone document. Please confirm which trees you would like costed up and I will arrange for a colleague to visit site prior to preparing a quotation for the works, which can then be carried out by one of our very experienced and professional contracting teams.

Signed:

Ken Sheppard, MICFor, FArborA, Dip Arb (RFS), Tech Cert (ArborA), CUEW.
Senior Arboricultural Consultant

DATE: 2nd April 2019

Appendix 2 BaNES Tree Preservation Order 2018 (University of Bath, Claverton Down, Bath. No. 317)

BATH AND NORTH EAST SOMERSET COUNCIL

(University of Bath, Claverton Down, Bath. No.317)

TREE PRESERVATION ORDER 2018

TOWN AND COUNTRY PLANNING ACT 1990

Relating to various individual trees, groups of trees and woodlands growing within the grounds of The University of Bath, Claverton Down, Bath

in the County and District of Bath and North East Somerset

Town and Country Planning Act 1990

The Bath and North East Somerset Council (University of Bath Claverton Down, Bath No. 317)

Tree Preservation Order 2018

The Bath and North East Somerset Council, in exercise of the powers conferred on them by section 198 of the Town and Country Planning Act 1990 make the following Order—

Citation

1 This Order may be cited as the Bath and North East Somerset Council (University of Bath, Claverton Down, Bath No. 317) Tree Preservation Order 2018.

Interpretation

2 (1) In this Order "the authority" means the Bath and North East Somerset Council.

(2) In this Order any reference to a numbered section is a reference to the section so numbered in the Town and Country Planning Act 1990 and any reference to a numbered regulation is a reference to the regulation so numbered in the Town and Country Planning (Tree Preservation)(England) Regulations 2012.

Effect

3 (1) Subject to article 4, this Order takes effect provisionally on the date on which it made.

(2) Without prejudice to subsection (7) of section 198 (power to make tree preservation orders) or subsection (1) of section 200 (tree preservation orders: Forestry Commissioners) and, subject to the exceptions in regulation 14, no person shall—

(a) cut down, top, lop, uproot, wilfully damage, or wilfully destroy; or

(b) cause or permit the cutting down, topping, lopping, uprooting, wilful damage or wilful destruction of,

any tree specified in the Schedule to this Order except with the written consent of the authority in accordance with regulations 16 and 17, or of the Secretary of State in accordance with regulation 23, and, where such consent is given subject to conditions, in accordance with those conditions.

Application to trees to be planted pursuant to a condition

2. In relation to any tree identified in the first column of the Schedule by the letter "C", being a tree to be planted pursuant to a condition imposed under

paragraph (a) of section 197 (planning permission to include appropriate provision for preservation and planting of trees), this Order takes effect as from the time when the tree is planted.

Dated this 23rd day of November 2018

Signed on behalf of the BATH AND NORTH EAST SOMERSET COUNCIL

Paula Freeland
Team Manager – Planning and Conservation
Development Management

Authorised by the Council to sign in that behalf

This Order was confirmed by Bath and North East Somerset Council on 20th March 2019 following a resolution of the Development Management Committee on 13th March 2019 to confirm the Order with a minor modification to map No. 4 of 6.

Signed on behalf of the BATH AND NORTH EAST SOMERSET COUNCIL

SCHEDULE

Specification of trees

Trees specified individually

(encircled in black on the map)

Reference on map	*Description*	*Situation*
T1	Lime	Located In planting bed in north west corner of East Car Park. Ordnance Survey ref: ST 775645
T2	Lime	Located in planting pit in East Car Park in second row from the west. Ordnance Survey ref: ST 775644
T3	Lime	Located in planting pit in East Car Park in third row from the west, second tree from the north. Ordnance Survey ref: ST 775645
T4	Lime	Located in planting pit in East Car Park in third row from the west, 4th tree from the north. Ordnance Survey ref: ST 775645

Trees specified by reference to an area

(within a dotted black line on the map)

Reference on map	*Description*	*Situation*
NONE		

Groups of trees

(within a broken black line on the map)

Reference on map	*Description (including number of trees of each species in the group)*	*Situation*
G1	3No. Cedar 7 No. Lime 8No. Horse Chestnut 5 No. Pine 4 No. Cherry	Located on the east side of the main entrance growing either side of a footpath on west boundary of playing field. Ordnance Survey ref: ST 774640
G2	3 No. Sycamore	Located on west side of University entrance between the road and the footpath. Ordnance Survey ref: ST 772646
G3	1 No .Ash 1 No. Sycamore 2 No. Maple 7 No. Pine	Located in an area between the main access road and 2 buildings. Ordnance Survey ref: ST 772646
G4	4 No. Maple 2No. London Plane	Located either side of main drive. Ordnance Survey ref: ST 774646
G5	2 No. Walnut 1 No. Ash 1 No. Norway Maple	Located around disabled car parking spaces and in grass area to north. Ordnance Survey ref: ST 772646
G6	2 No. Norway Maple	Located adjacent to the road on the north side of mixed species tree group. Ordnance Survey ref: ST 771646
G7	5 No. Pine 2 No. Maple	Located to south of Conygre accommodation building Ordnance Survey ref: ST 771647

G8	7 No. Pine 1 No,. Beech	Located on site boundary adjacent to west entrance to Quarry accommodation building. Ordnance Survey ref: ST 769647
G9	12 No. Lime 1 No. Oak 1 No. Maple	Located adjacent to main one-way drive through the site. Ordnance Survey ref: ST 775647
G10	8 No. Birch 2 No. Oak	Located in grass area between main drive and buildings to north. Ordnance Survey ref: ST 774647
G11	1 No. Turkish Hazel 2 No. Lime ! No. Oak	Located adjacent to junction on main drive on both sides of the road. Ordnance Survey ref: ST 774646
G12	16 No. Beech	Located on the main site access from the east car park on the east site boundary. Ordnance Survey ref: ST St775646
G13	1 No. Wellingtonia 6 No. Purple Norway Maple 1 No. Handkerchief Tree 3 No. Hybrid Poplar	Located on south side of footpath between gardens and car park on the north side of the bund. Ordnance Survey ref: ST 773643
G14	4 No. Wellingtonia 3 No. Blue Atlas Cedar 4 No. Silver Maple 3 No. Dawn Redwood 2 No. Swamp Cypress	Located in tree group on the south side of the lake between buildings to the south from the lake area. Ordnance Survey ref: ST 772643
G15	1 No. Lime ! No. Box Elder 1 No. Maple	Located within planting beds at south entrance to University building from lake area. Ordnance Survey ref: ST 777645

G16	5 No. Maple 1 No. Ash 1 No. Robinia 1 No. Walnut	Located on the north west boundary of lawn to the north of the lake growing on as bund that slopes down to a footpath to the west. Ordnance Survey ref: ST773644
G17	15 No. Beech 1 No. Pine 2 No. Maple 1 No. Cedar 1 No. Persian Ironwood	Located between footpaths to the west of the lake. Ordnance Survey ref: ST771644
G18	3 No. Beech	Located adjacent to access road to west of lake area. Ordnance Survey ref: ST 771644
G19	5 No. Norway Maple	Located on west side of access road. Ordnance Survey ref: ST 771644
G20	3 No. Field Maple 2 No. Cherry	Located in two planting beds on east side of the south end of the main north/south access through the east car park. Ordnance Survey ref: ST 776645
G21	16 No. Beech	Located in planting beds either side of the main north/south access route through the east car park, adjacent to coach parking bays. Ordnance Survey ref: ST776645
G22	3 No. Cherry 4 No. Field Maple	Located to the south of the east car park, opposite the East building on the north side of the car park access road. Ordnance Survey ref: ST 776645

G23	6 No. Field Maple 6 No. Cherry 5 No. Beech 1 No. Ash	Located on a bund orientated north to south in east car park opposite the west end of the East Building. Ordnance Survey ref: ST775645
G24	3 No. Field Maple 4 No. Cherry	Located in three planting beds in south west corner of the east car park, on north side of access road. Ordnance Survey ref: ST 775644
G25	2 No. Lime	Located at north end of grass area to west of car park and east of main drive. Ordnance Survey ref: ST 775642
G26	3 No. Field Maple 3 No. Turkish Hazel	Located on the east and north perimeter of a tree group located on a bund to the west of the main drive into the campus and to the south of the Sports Institute Building. Ordnance Survey ref: ST 770642
G27	1 No. Pine 8 No. Beech	Located outside of Building 3 South, between the building and access road into the site from the south boundary. Ordnance Survey ref: ST 771643
G28	3 No. Beech 1 No. Yew	Located on north boundary of garden to south of car park. Ordnance Survey ref: ST 770642
G29	5 No. Horse Chestnut 7 No. Beech 2 No. Oak	Located on north side of footpath on south site boundary. Ordnance Survey ref: ST 769644

G30	36 No. Birch	Located on the west boundary of the west car park between car park and access road to west. Ordnance Survey ref: ST 768646
G31	4 No. Western Red Cedar 3 No. Birch 4 No. Pine	Located on west side of Polden Building. Ordnance Survey ref: ST 769646
G32	1 No. Beech 1 No. Holm Oak	Located in grass area to west of the School of Management and to the east of the footpath to the east of the lake. Ordnance Survey ref: ST 772644

Woodlands

(within a continuous black line on the map)

Reference on map	*Description*	*Situation*
W1	Mixed species woodland, primarily deciduous broadleaf dominated by Sycamore but including Beech, Larch, Elder, Ash, Hawthorn, Hazel	Located on the north side of Claverton Down Road, between the road and playing fields. Ordnance Survey ref: ST 774638
W2	Mixed species deciduous and evergreen coniferous and broadleaf woodland dominated by coniferous trees. Species include Sycamore, Larch, Beech, Spruce, Western Red Cedar, Cypress, Yew, Cedar, Goat willow, Birch and Oak.	Located on the west side of the main entrance to the University between driveway and tennis courts. Ordnance Survey ref: ST 774640
W3	Mixed deciduous and evergreen broadleaf species linear woodland compartment. Species include Beech, Yew, Ash, Oak, Lime, Field Maple, Holly and Hazel.	Located on the south site boundary of University campus. Ordnance Survey ref: ST 773641

W4	Mixed deciduous and evergreen species woodland compartment. Species include Douglas Fir, Beech, Ash, Sycamore and Spruce.	Located on the south site boundary of University campus. Ordnance Survey ref: ST 771642
W5	Mixed species coniferous and broadleaf linear woodland compartment containing evergreen and deciduous trees. Species include Ash, Beech, Cypress, Oak and Horse Chestnut.	Located on south site boundary between stone wall and playing fields. Ordnance Survey ref: ST 769643
W6	Mixed species coniferous and broadleaf woodland dominated by deciduous broadleaf trees. Species include Beech, London Plane, Ash, Lime, Willow, Yew, Redwood and Cypress.	Located between the Lodge and Medical Centre. Garden boundary group with frontage on to North Road. Ordnance Survey ref: ST 768644
W7	Mixed species coniferous and broadleaf woodland compartment dominated by deciduous broadleaf trees.. Species include Ash, Horse Chestnut, Beech, Yew, Sycamore, Hazel, Lime, Spruce, Cypress, Pine, Holly and Birch.	Located on western boundary of Medical Centre, the south west end is onto North Road and the west end is onto the south west access road. Ordnance Survey ref: ST 768645
W8	Mixed deciduous broadleaf species linear woodland compartment. Species include Oak, Sycamore, Beech, Hawthorn, Birch and Ash.	Located on the east boundary, between dry stone wall and a footpath. Extends up to a metal field access gate to the north. Ordnance Survey ref: ST 768646
W9	Mixed species coniferous and broadleaf woodland dominated by deciduous broadleaf trees. Species include Ash, Oak, Beech, Pine, Hawthorn, Sycamore, Elder and Holly.	Located between the main drive through the site and the north site boundary. Ordnance Survey ref: ST 773647

W10	Mixed species coniferous and broadleaf linear woodland compartment containing evergreen and deciduous trees. Species include Oak, Sycamore, Beech, Hawthorn, Birch, Ash, Holly and Goat Willow.	Located between north boundary wall and perimeter footpath. Ordnance Survey ref: ST 770648
W11	Mixed species coniferous and broadleaf woodland compartment containing evergreen and deciduous trees.. Species include Oak, Hazel, Ash, Western Red Cedar, Norway Maple, Larch, Hawthorn, Elm and Sycamore.	Located at the east wend of the north University site boundary between the accommodation buildings and the dry stone wall marking the boundary. Ordnance Survey ref: ST 774648
W12	Mixed species coniferous and broadleaf linear woodland compartment containing evergreen and deciduous trees. Species include Oak, Maple, Ash, Hornbeam, Holly, Beech and Sycamore.	Located on the site perimeter between the perimeter footpath and the boundary. Ordnance Survey ref: ST 776647
W13	Mixed species coniferous and broadleaf linear woodland compartment containing evergreen and deciduous trees. Species include Beech, Sycamore. Yew, Horse Chestnut and Hawthorn.	Located on the north side of The Avenue between east site boundary and main drive into site. Ordnance Survey ref: ST 777641
W14	Mixed species coniferous and broadleaf linear woodland compartment containing evergreen and deciduous trees. Species include Oak, Beech, Ash, Hawthorn, Horse Chestnut, Yew, Hornbeam and Lime.	Located on south side of the Avenue between stone boundary wall, the entrance to the University and Bath Cats and Dogs Home. Ordnance Survey ref: ST 776641

W15	Mixed species coniferous and broadleaf linear woodland compartment containing evergreen and deciduous trees. Species include Oak, Beech, Ash, Hawthorn, Horse Chestnut, Yew, Hornbeam, Sycamore and Lime.	Located on south side of The Avenue between stone boundary wall, road, Bath Cats and Dogs Home and access gate into compound on east site boundary of University. Ordnance Survey ref: ST 778640
W16	Mixed species coniferous and broadleaf woodland compartment containing evergreen and deciduous trees. Species include Sycamore, Ash, Field Maple, Oak, Beech, Elder, Holly and Horse Chestnut.	Located on east site boundary (up to access track not field boundary) adjacent to playing fields to the south of The Avenue and to the north of Claverton Down Road. Ordnance Survey ref: ST 779639
W17	Mixed species coniferous and broadleaf woodland compartment containing evergreen and deciduous trees. Species include Yew, Cypress, Larch, Beech, Spruce, Maple, Walnut, Cherry, Cedar and Sycamore	Located on the south side of open grass area to the west of the sports Institute Building and main driveway into the site. Ordnance Survey ref: ST 773643
W18	Mixed species coniferous and broadleaf woodland compartment containing evergreen and deciduous trees. Species include Oak, Maple, Ash, Hornbeam, Holly, Beech and Sycamore.	Located on east University site boundary to east of playing fields. Ordnance Survey ref: ST 779642
W19	Mixed species coniferous and broadleaf woodland compartment containing evergreen and deciduous trees. Species include Cherry, Beech, Sycamore, Hawthorn, Field Maple, Holly, Yew, Hazel and Ash	Located on bund between the east end of the east car park, the footpath on the east site boundary and the entrance to the car park entrance south. Ordnance Survey ref: ST 776645

W20	Mixed species coniferous and broadleaf woodland compartment containing evergreen and deciduous trees. Species include Cherry, Hazel, Holly, Ash, Sycamore, Field Maple, Hawthorn, Beech and Holm Oak.	Located on bund to the south east of car park, between the car park, tennis courts, car park extension, running track and the east side of East Building. Ordnance Survey ref: ST 776644
W21	Mixed species coniferous and broadleaf woodland compartment containing evergreen and deciduous trees. Species include Beech, Cedar, Pine, Larch, Maple, Yew, Willow, Birch and Western Red Cedar	Located between north boundary car park and the footpath to the south of University Building 8W. Ordnance Survey ref: ST 770645
W22	Mixed species coniferous and broadleaf woodland compartment containing evergreen and deciduous trees. Species include Beech, Horse Chestnut, Pine, Ash, Hazel, Holly, Cherry and Pine.	Located between the south boundary of the west car park and the footpath to the south. Ordnance Survey ref: ST 768645
W23	Mixed species coniferous and broadleaf woodland compartment containing evergreen and deciduous trees. Species include Field Maple, Pine, Yew, Holly, Ash, Hawthorn and Oak.	Located through the centre of the west car park running east to west. Ordnance Survey ref: ST 769645

Table of Contents

Introduction

The University of Bath is currently developing a dedicated tree policy which will form an appendix to the LEMP being formulated in association with the University, Chris Enderby (Enderby Associates) and Sara King (Ecosulis).

As part of this, we are looking at the future management and renovation of The Avenue and I would like to seek the council's opinion of our preferred option. Set out below are the options considered and our conclusion as to our preferred option. Our intention is to set out a mutually acceptable plan for the next 20-30 years.

Current Situation

The Avenue was surveyed as Zone 4 of the 2018/2019 university-wide tree survey. It is considered to be a distinct landscape feature and one requiring its own special consideration if it is to be successfully perpetuated into the future. Some sections of the feature are believed to be outside university ownership and the responsibility of BANES; a joint management plan is therefore essential if a full regeneration scheme is to be achieved. Ownership boundaries are to be confirmed by the University and BANES a in due course.

The area can reasonably be divided into two sections, these being to the east and to the west of Convocation Avenue. The area to the east is somewhat restricted by consented sports pitches and sports facilities. In places, this can be as narrow as 15 metres with a public footpath running through it. The western side has more of a woodland character being somewhat wider. Again, the public footpath runs through the area as does the engineered bund, containing the main gas supply, along the rear of the estates yard and buildings.

Both footpaths are considered to have high occupancy rates by both students and members of the public including volunteer dog walkers for the kennels. The path is well used throughout the year and in all weather conditions.

The original concept was that of an avenue of mainly Beech running each side of the lane. Many of the original trees have been lost over time and the remaining mature/over mature trees are now reaching the end of, or are beyond, their natural life expectancy. Many are extensively decayed and/or are forming mutually supporting small groups which would be prone to wind throw should the older dominant trees be removed.

Over the last few decades, new planting has been installed to try and perpetuate the feature and changing it from two lines of trees to two rather narrow and restricted linear woodlands. The species mix now includes Hornbeam, Horse Chestnut, Oak, Birch, Maple and Cherry with an understorey of Yew, Holly and Hazel. In some places, particularly on the west side of Convocation Drive, Laurel has been planted to provide low level screening all year round,.

Unfortunately, the renovation program was either ill-conceived or not documented and with on-going management being neglected. As trees became established, the mature trees were not removed resulting in young trees becoming heavily suppressed and misshapen. In addition, many of the thin barked species of Beech, Hornbeam and Sycamore have been extensively squirrel damaged, further reducing the possibility of them reaching maturity with a good, defect free, form.

Regardless of the option chosen, the University recognises that it will need to maintain annual squirrel control if new trees are to be established and reach their full design potential.

The University recognises that no matter which course of action is decided, full consultation will be required with all interested parties, including local residents that are likely to be alarmed at any tree felling along this boundary.

Proposed Management Options

I believe the first thing to decide is whether the feature is to be developed into a linear woodland or whether, given the limited width, re-established as more formal avenue feature.

I have considered if it would be possible to establish a new avenue feature along the outside edge of the current one. However, due to the limited space and proximity of consented sports facilities I do not believe this is a viable option.

All options will require a long term commitment in terms of future management, budgets and aftercare. Planting design, installation and aftercare will form part of the tree policy to be implemented site wide.

There follows a list of the options which I think we could consider.

Option (1) - Develop as a Linear Woodland

Phased removal of over-mature Beech over a 20 year period; removing small groups where necessary to prevent wind throw, and reducing adjacent trees to reduce the risk of failure in the short term.

Select the best of the existing established planting for retention and formative prune.

Remove the poor quality trees, the majority of which are young, to create space for new high quality planting.

Advantages

- Provides a mix of large species for wider landscape value together with a range of edge and understorey species to improve low level screening.
- Works can be completed in sections thereby retaining the essence of the feature for a longer period of time.
- Space is provided for the design and preparation of planting areas is planned so as not to compromise the rooting area of existing trees.
- Existing trunks retained of over mature Beech to provide deadwood habitat, reducing the cost of disposal and stump grinding.
- Phased replacement will provide a multi species feature with wide age distribution.
- Greater future resilience of feature in terms of climate change and species specific diseases.
- Phased replacement spreads the cost over several budget periods.

- Species mix could include evergreens to assist all year round screening and softening from south.

Disadvantages

- Loss of individuals/ groups having short to medium term impact on landscape/amenity value of feature.
- Phased removal resulting in potential damage to establishing neighbouring trees.
- Higher cost of felling and tree surgery. Reduction works will require on going management until trees are felled and replaced.
- Loss of historic formal Avenue feature.
- Limited space adjacent to existing sports features reducing species choice and density.
- Increasing future impacts (shading, leaf and debris fall) onto adjacent sports pitches.
- Increased risk of wind throw and /or storm damage to remaining mature trees due to alterations in wind patterns.
- Potential safety issues related to decay in large standing deadwood over the next two to three decades.

Option (2) - Create New Formal Avenue

Clear fell entire feature (possibly in two phases: east and west of Convocation Avenue) but retaining historic Beech as monoliths. Install two lines of high quality identical species at final spacing with nurse species infill. Nurse species removed and replaced with shade tolerant understorey planting as specimen trees develop.

Advantages

- Re-establishes historic Avenue feature of identical trees of similar growth rate.
- Good option given limited space east of Convocation Avenue.
- Opportunity to change species to one which has greater climate change resilience.
- Reduced number of trees to maintain.
- Opportunity to prepare and improve planting area prior to installation without impacting on roots of retained trees.
- Works completed in two phases reducing risk of wind throw and damage by maintaining existing blocks which give mutual support. Retained block of trees requiring minimum surgery to maintain stability.

- Existing trunks retained and veteranised to provide deadwood habitat. Retention will reduce the cost of disposal and stump grinding.

- Two distinct elements of landscape feature created, that is specimen trees and understorey, making them easier to manage with less skilled and fewer staff.

- Easier to assess future budget requirements as operations are carried out in a maximum of two phases

Disadvantages

- High initial cost of felling and replacement as completed in only one or two phases.

- High visual impact due to loss of trees in initial stages.

- Increased risk of wind throw to remaining trees adjacent to Convocation Avenue due to the loss of companion shelter.

- Limited resilience to species specific diseases. Increased risk of rapid loss of entire feature in future.

- Future management difficult as loss of individual trees results in significant degradation of the landscape feature.

- Loss of high level bat corridor in short term.

- Potential safety issues related to decay in large standing deadwood over the next two to three decades.

Option (3) - Localised Tree Removal and Replacements.

This is similar to option (2) but will be completed over a longer time scale, depending on the deterioration of mature and over-mature trees.

Select the best of the existing established planting for retention and formative prune.
Remove poor quality trees (mostly young / middle aged) to create space for new planting.
Remove over-mature Beech as they are deemed unsafe/ uneconomic to retain.

This option can be completed in sections thereby retaining the essence and wider landscape benefits of the feature for a longer period of time.

Advantages

- No formal time frame - works completed as required but focused on tree establishment.

- Existing trunks retained and veteranised to provide deadwood habitat. Retention reducing costs associated with disposal and stump grinding.

- Phased replacement will provide a multi specie feature with wider age distribution.

- Greater future resilience of feature in terms of climate change and species specific diseases.

- Phased replacement spreads cost over several budget periods.

- Species mix could include evergreens to assist all year round screening and softening from south.

- Loss of individuals in future having reduced impact on landscape/amenity value.

Disadvantages

- Loss of individuals likely to result in the need for felling or reduction works to adjacent exposed trees to minimise wind throw and/or storm damage.

- Difficult to set targets and budgets as replacement is driven by decline in existing tree stock.

- Phased removal resulting in potential damage to good quality established neighbouring trees.

- Preparation of planting areas has the potential to compromise the rooting area of existing trees.

- Trees not in final stages of decline may require early removal to favour development of establishing trees.

- Initial loss of low level tree cover will reduce screening of sports facilities.

- Increased risk of wind throw to remaining mature trees due to alterations in wind patterns.

- Increased costs for felling and tree surgery over longer time period.

- Reduction works will require ongoing management until all the poor quality trees are felled and replaced.

- Loss of historic formal Avenue feature.

- Limited space adjacent to existing sports features reducing species choice and density.

- Potential safety issues related to decay in large standing deadwood.

- Risk of works stalling due to reducing budgets and changes in University priorities.

Preferred Option

On balance, and given that the avenue character has deteriorated, the University's preference is for Option (1): developing the area as a woodland feature over a 20 year period.

This would allow the university to plan and budget for the works, allow targets to be set on tree replacement and maintenance and set a designated end target date when the scheme can be reviewed, amended and a rolling plan produced.

Do feel free to add any additional thoughts for consideration before I formalise the agreed strategy with The University and yourselves.

Kind regards

Ken Sheppard, MICFor, FArborA, Dip Arb(RFS), TechCert(ArborA), CUEW.
Senior Arboricultural Consultant
